IMPORTANT:

The current safety provisions of the state or professional organisations in each country must be followed when using our products.

The pictures in this document are snapshots of situations at different stages of assembly, and therefore are not complete images for safety purposes and should not be deemed as definitive.

All instructions regarding safety and operation contained in this document, as well as the data on stress and loads, must be respected. Any changes or unusual assembly will require a special solution or calculation.

The weights featured in this document, related to the basic product parts, are approximate.

Our equipment is designed to work with accessories and components produced by our company. Combining such equipment with other brands without having made all the corresponding checks can be dangerous.

The company reserves the right to introduce any modifications deemed necessary for the technical development of the product.

1. PRODUCT DESCRIPTION

ENKOFLEX is a horizontal formwork system designed for making any kind of slab, both solid and lightened, as well as hanging beams or other items.

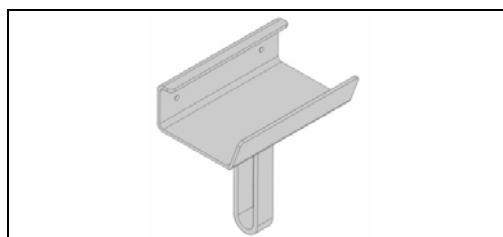

Because this formwork is composed of independent beams, the system has great flexibility, allowing it to be adapted properly for irregular slabs.

It is also the ideal complement for infilling and areas not covered with other formwork systems, such as Table VR or CC-4.

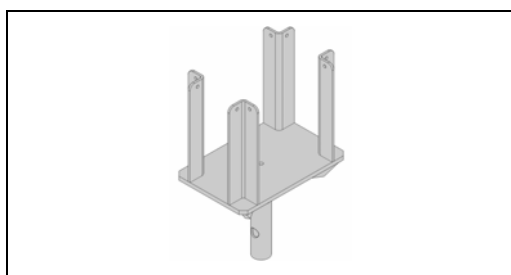

The main features of the system are as follows:

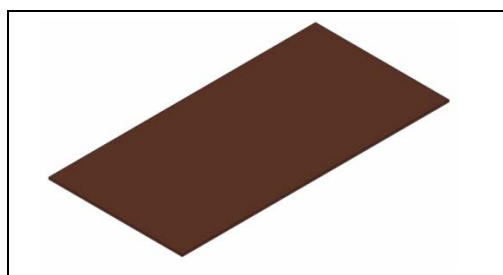

Timber Beam VM 20

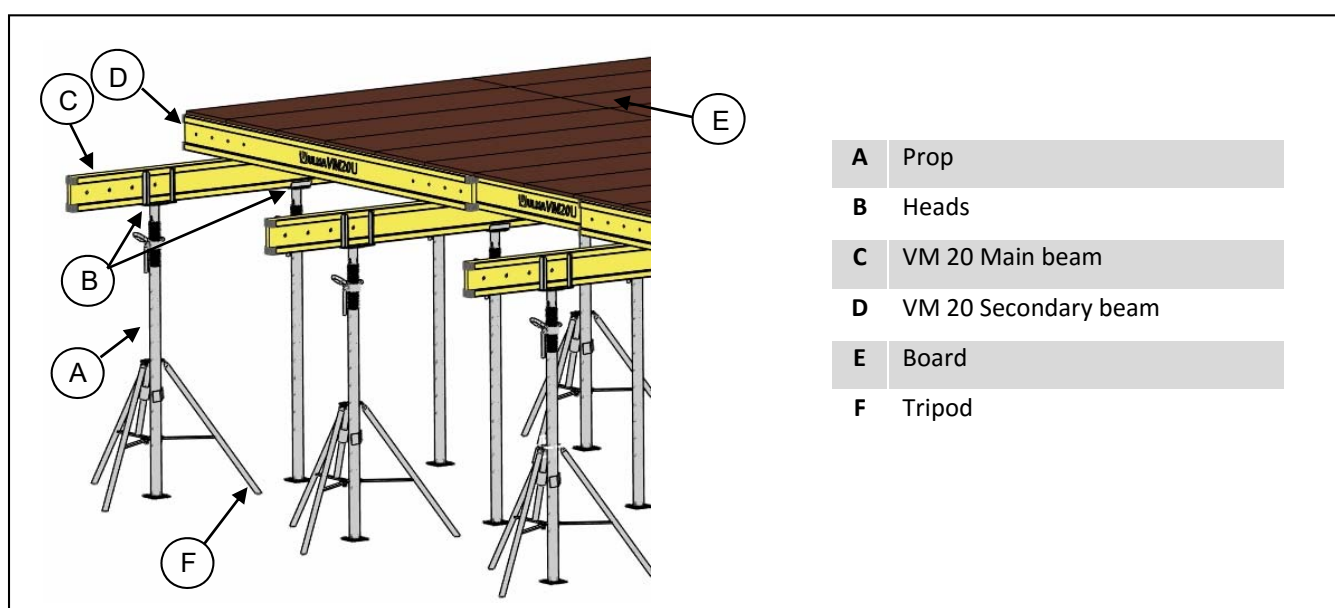

Simple Head

Double Head

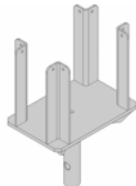

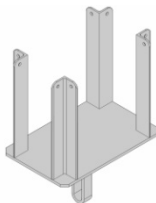

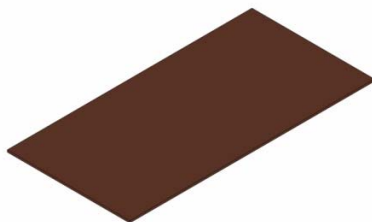

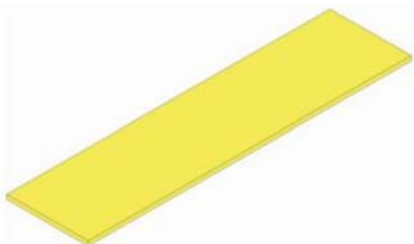

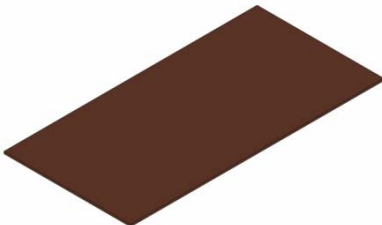

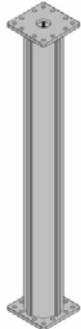

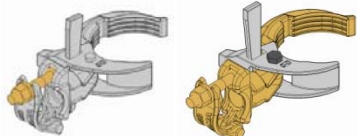

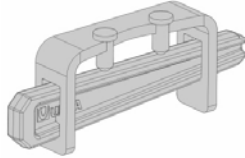

Plywood

2.2. ELEMENTS DESCRIPTION

Item dimensions are measured in millimetres unless otherwise indicated.

2.2.1. TIMBER BEAMS VM 20

These form the ENKOFLEX system press grid.

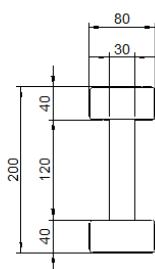

The timber beam VM 20 is used as a main or secondary beam.

It is made in accordance with Standard EN13377.

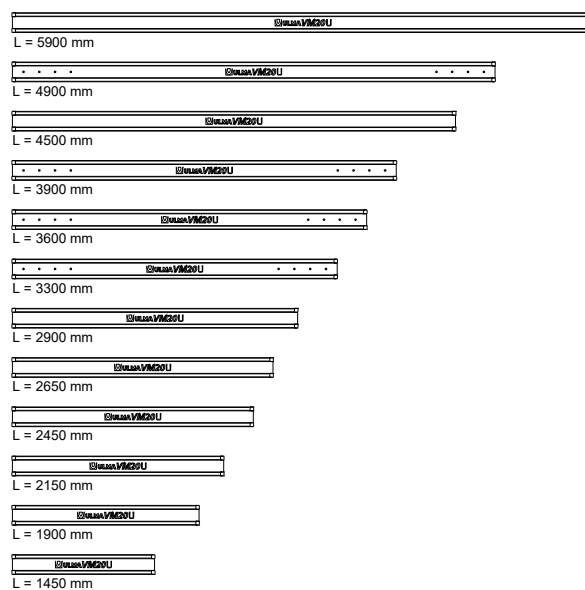

The technical features are:

- | | |
|---------------------------|-------------------------|
| - Permissible shear force | Q=11 kN |
| - Permissible flexion | M=5 kNm |
| - Stiffness | El=450 kNm ² |

Section of the timber beam VM 20:

There is a wide range of standard lengths, reaching up to 5.9 m. There are special beams available of up to 12 m in length.

The 4.9 m, 3.9 m, 3.6 m and 3.3 m beams have holes incorporated into the ends.

2.2.2. BOARDS

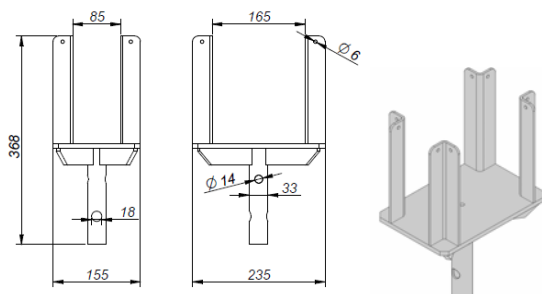

For high-end architectural requirements and/or smooth concrete surfaces with good finish, phenolic plywood panels can be used.

- Plywood 1.25 x 2.5 x 0.018 BETO
- Plywood 1.25 x 2.5 x 0.021 BETO
- Plywood 1.25 x 2.5 x 0.018 BIRCH
- Plywood 1.25 x 2.5 x 0.021 BIRCH

Other types of wood can also be used, such as 3-layer plywood.

2.2.3. DOUBLE HEAD VR

This is used to shore main beams, for both single and double beams. it is mounted at beam ends and overlaps.

The head has four L profiles with holes for fixing to the beam with nails.

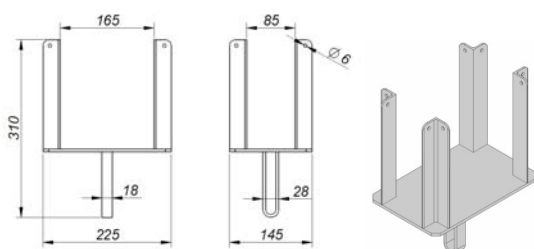

It can be fixed to the prop with 16x100 pins (item number 1861627) and R/3 cotter pins (item number 9370571).

It is a galvanized robust head with a tubular plug.

It is important to emphasise that it cannot be used with normal props.

2.2.4. ECO DOUBLE HEAD

This is used to shore main beams, for both single and double beams. It is mounted at beam ends and overlaps.

The head has four L profiles with holes for fixing to the beam with nails.

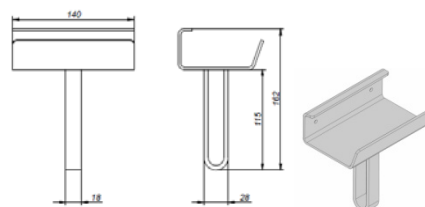

It can be fixed to the prop with 16x100 pins (item number 1861627) and R/3 cotter pins (item number 9370571).

It is a lightweight zinc-coated head with a bend sheet plug.

2.2.5. SIMPLE HEAD VR

This is used to shore single main beams.

This head can be assembled with all ULMA props.

The open profile allows the assembly head to be fixed and released from the prop without loosening the prop's thread.

It can be fixed to the prop with 16x100 pins (item number 1861627) and R/3 cotter pins (item number 9370571).

2.2.6. PROPS

Wide range of props to conform with construction shapes and utilisation criteria in the different countries where it is used.

- SP props

ITEM NUMBER	NAME	EXTENSION (m)

2770026	ECO PROP 1.75/3 W/HANDLES	1.75	3
2161500	ECO PROP 2.1/3.5	2.1	3.5

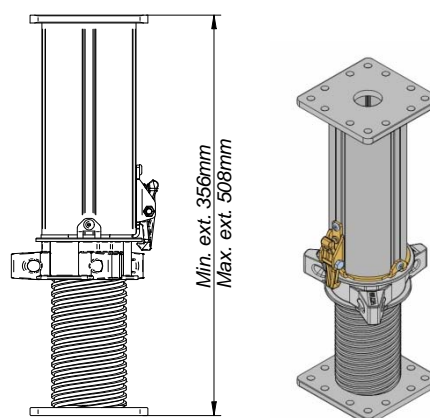

All these props are fixed to the wooden beams using the heads which support the wooden beams.

For normal props, double head VR cannot be used.

2.2.7. ALUPROP SPINDLE

The aluprop spindle is designed for ALUPROP configurations where a double adjustment in height is required. In addition, this configuration facilitates the stripping of the system through the placement of the aforementioned prop at the base of the assembly.

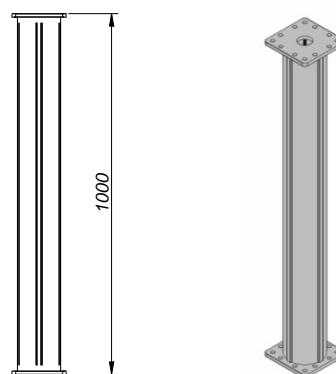

The outer tube is fixed to the prop's outer tube by means of four bolts, nuts and washers or by means of two aluprop clamps.

2.2.8. SUPPLEMENT 1M

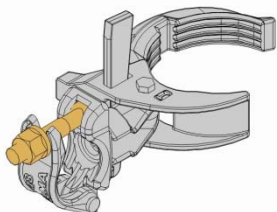

The supplement 1M allows the ALUPROP prop's range of dimensions to be extended.

It is fixed to the ALUPROP prop's outer tube by means of four bolts, nuts and washers or by means of two aluprop clamps.

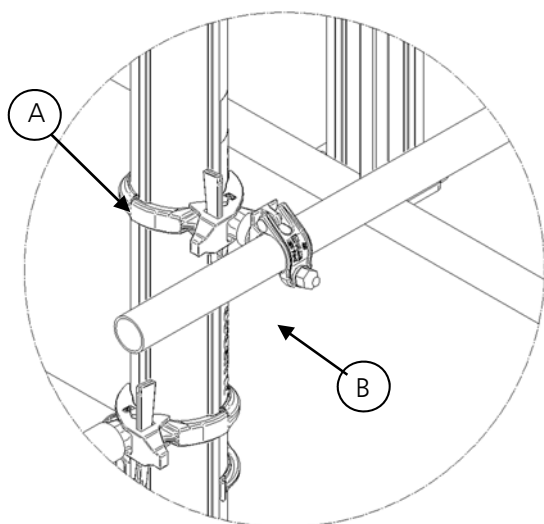

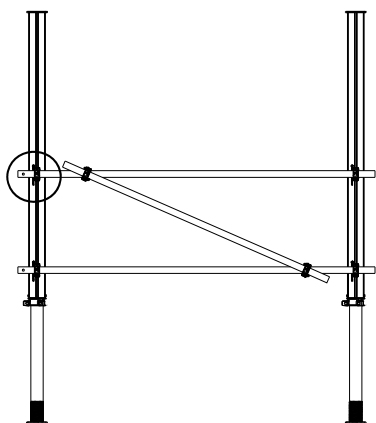

2.2.9. FIX BRACING HOOK

It allows two props with different towers to be braced increasing their strength and stability.

It is used to connect the outer tube of the ALUPROP prop to a 48 mm tube by means of the hook and 48 mm coupler. This makes it possible to then install safety handrails in the towers.

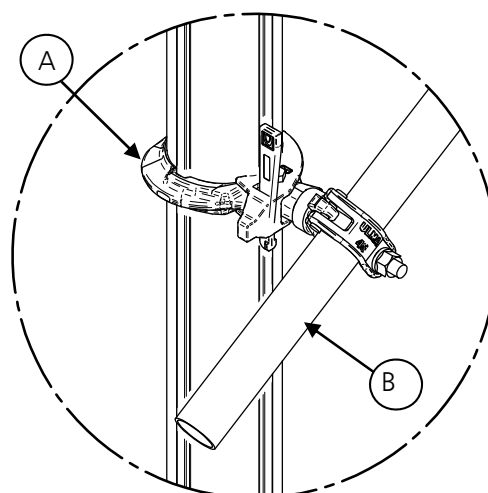

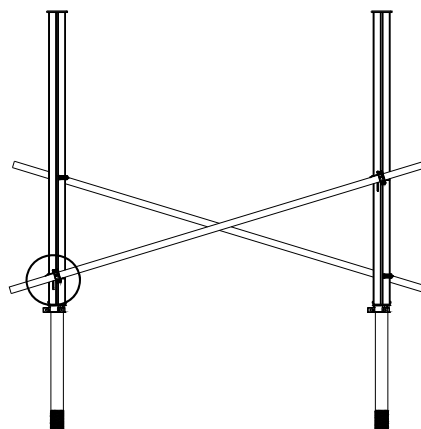

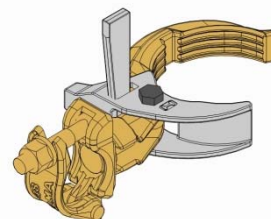

A Fix bracing hook

B Tube $\varnothing 48$

2.2.10. SWIVEL BRACING HOOK

This allows the outer tube of the ALUPROP to be connected to a 48 mm tube, forming any angle between the hook and the 48 mm swivel coupler.

It makes it possible to horizontally and vertically brace the ALUPROP towers and install safety handrails in the towers.

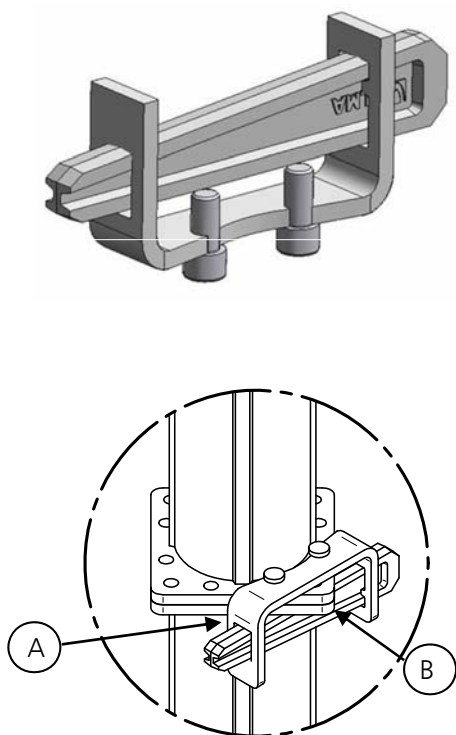

A Swivel bracing hook

B Tube $\varnothing 48$

2.2.11. ALUPROP CLAMP

Designed to quickly join the supplement 1m or Aluprop spindle to the ALUPROP prop, as well as to fix the outer tubes of the ALUPROP props. It is fixed using two Aluprop clamps.

The Aluprop clamp has two guide pins to locate in the ALUPROP prop end plate and a wedge to join the props.

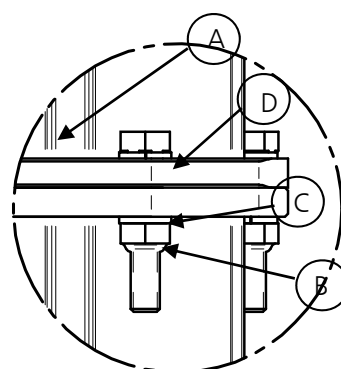

A Aluprop clamp

B End plate

2.2.12. NUTS AND BOLTS

Connecting elements between ALUPROP end plates, supplements 1m or Aluprop spindle. The elements are:

- Hexagonal bolt M10X50 DIN 933 8.8
- Nut M10 DIN934 5.6
- Spring washer B10 DIN 127

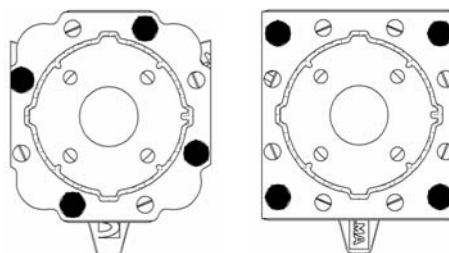

A Bolt

B Nut

C Washer

D End plate

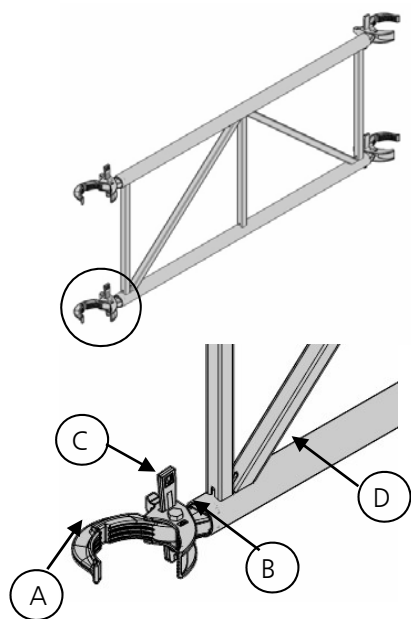

Nuts and bolts fixing position depending on the shapes of the ALUPROP end plate.

2.2.13. BRACING FRAME

Formed by steel tubes and four hooks with wedges to embrace the ALUPROP outer tube.

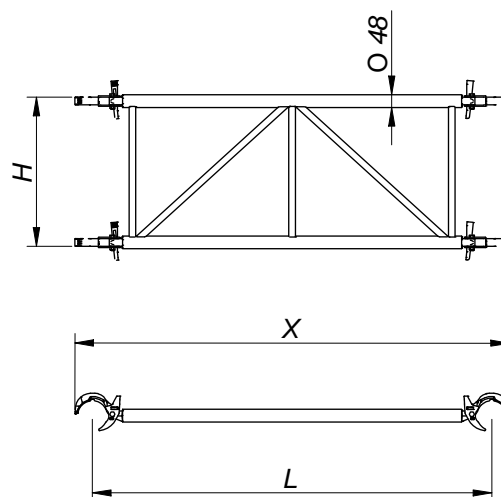

The bracing frame allows the joining of props, supplement 1m and Aluprop spindle to form shoring towers.

A	Fixed hook
B	Mobile hook
C	ALUPROP wedge
D	Tube ø48

The fixed hook and the ALUPROP outer tube being the same shape allows the prop's outer tube to be embraced, adjusting it by means of tightening the wedge of the mobile hook

The tubular structure of the frame is steel and is formed by two 48 mm diameter horizontal tubes. These horizontal tubes, spaced at 530 mm, allows couplers and tubes to be braced and the 1.5 m steel platforms to be used as working platforms.

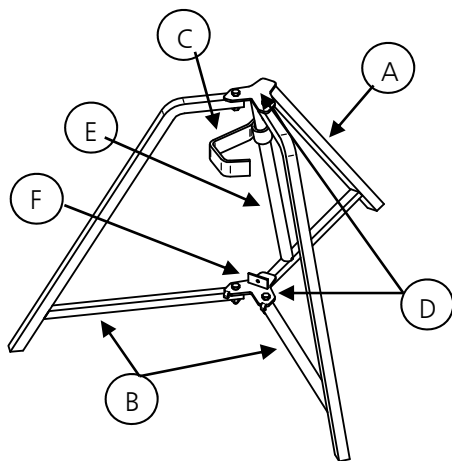

BRACING FRAME	Weight (Kg)	L (mm)	X (mm)	H (mm)
2.32 m	17.7	2320	2451	558
2.075 m	18.1	2075	2212	558
1.5 m	13.6	1500	1631	558
1.57 m	13.8	1570	1701	558
0.75 m	8.7	750	881	558

2.2.14. UNIVERSAL TRIPOD

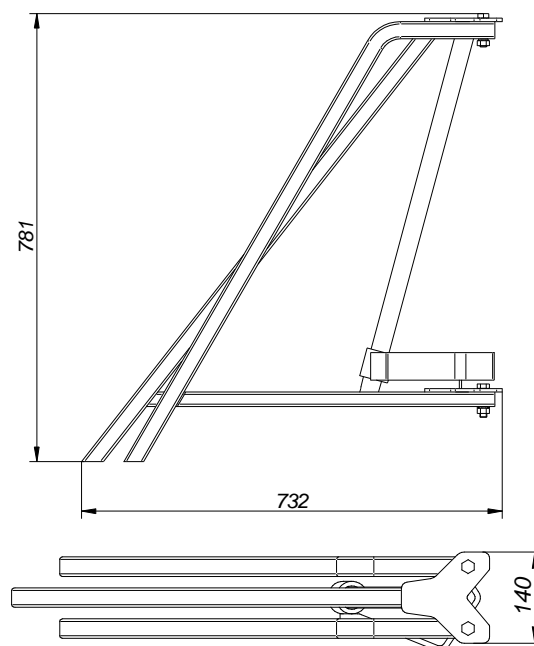

Designed to stabilise and ensure the correct assembly of ULMA props with diameters of between 40 and 120 mm. It consists of two mobile supports that allow its correct positioning, a restraint bearing that includes a base frame to hold the prop and a clamp that slides on a tilted tube to fix the props.

The lower base frame has a plate that allows a piece of wood to be attached and compensates for the difference in diameter in cases where the tripod is holding tubes of different diameter.

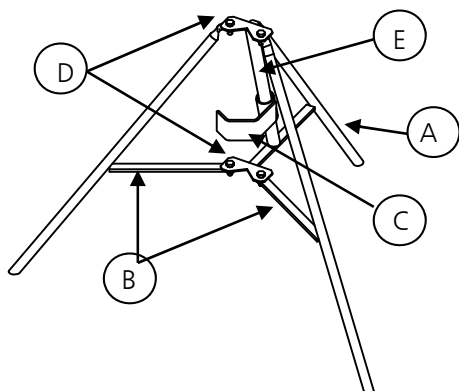

- | | |
|---|--------------------|
| A | Restraint bearing |
| B | Swivel support |
| C | Clamp |
| D | Base frame support |
| E | Clamp guide |
| F | Nailing stop |

Dimensions of folded tripod:

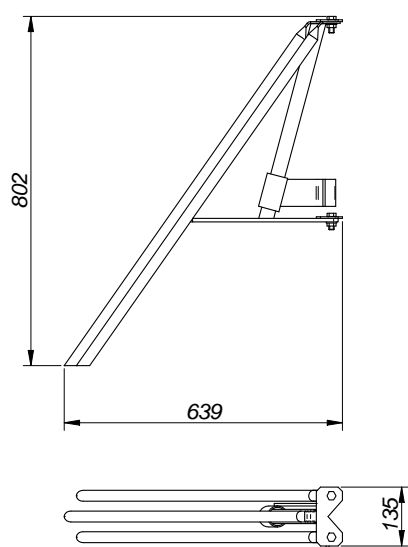

2.2.15. TRIPOD 42-87 mm

Designed to stabilise and ensure the correct assembly of ULMA props with diameters of between 42 mm and 87 mm. It consists of two mobile supports that allow its correct positioning, a restraint bearing that includes supports to hold the prop and a clamp that slides on a tilted tube to fix the props.

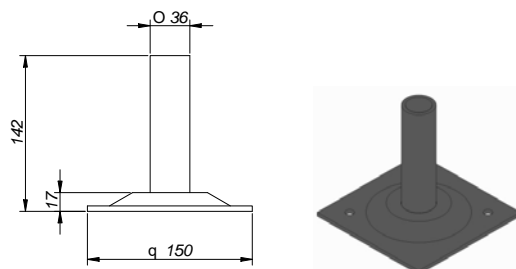

A	Restraint bearing
B	Swivel support
C	Clamp
D	Base frame support
E	Clamp guide

Dimensions of folded tripod:

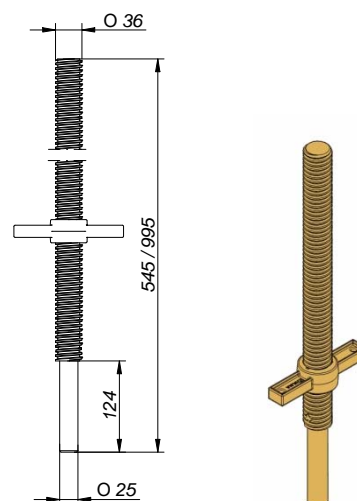

2.2.16. BASE PLATE G

This is placed in the initial phase of assembly, when the layout is implemented based on the project plan. It provides a stable support to the shoring.

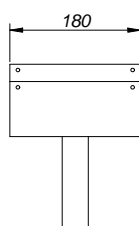

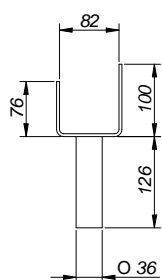

2.2.17. BASE JACK

This is used to level the structure and to adjust the shoring to the required dimension. It is placed in the initial assembly phase by inserting it into the base plate, and in the final phase by inserting it into the supplement without spigot.

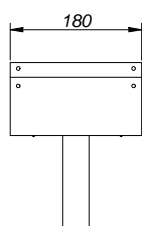

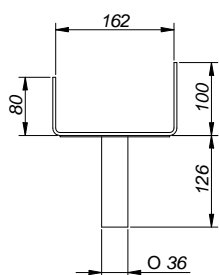

2.2.18. HEAD 80 and 160

Item for using formwork with the traditional system, being the sufficient size for housing a plank on its side.

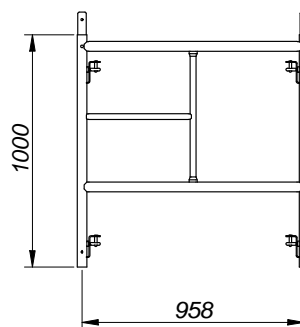

Head 80

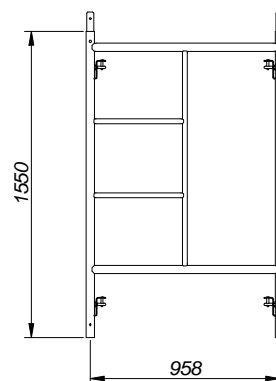

Head 160

2.2.19. FRAME G-100

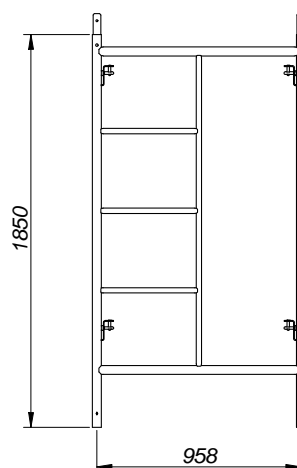

Item formed by a two-part frame. There is a series of horizontal tubes in one of these parts which can be used as a ladder.

FRAME G-100 1

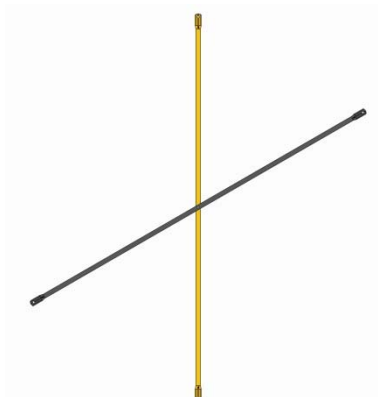

FRAME G-100 1.55

FRAME G-100 1.85

2.2.20. CROSSBRACES

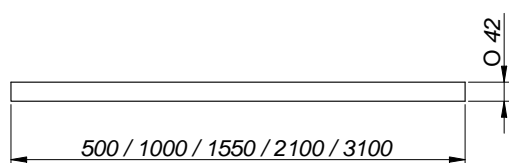

Tubes of identical size joined by means of a rivet which allows turning from one side to the other. Once assembled, they are the shape of a tick.

The cross members provide exact spacing between supplements.

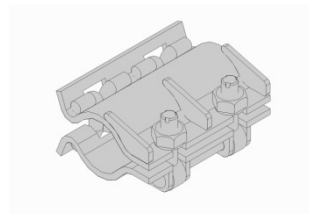

2.2.21. TUBES $\varnothing 42$

Items of different lengths. They have many and varied uses such as joining chained items, tying towers, etc.

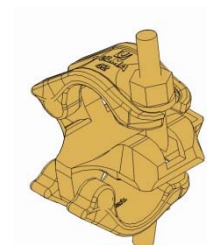

2.2.22. TENSION COUPLER 42

This is designed to connect two 42 mm diameter tubes. It consists of two semi-couplers joined to allow two continuous tubes to be connected with an axial joint.

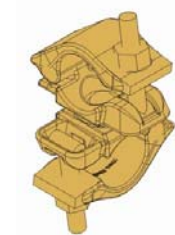

2.2.23. RIGHT ANGLE COUPLER 42/42

Item that allows different 42 mm diameter components to be joined with an orthogonal connection.

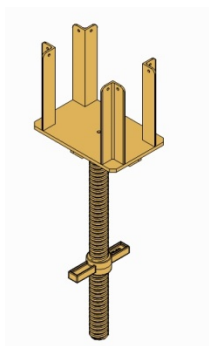

2.2.24. SWIVEL COUPLER 42/42

Item that allows different 42 mm diameter components to be joined with a swivel connection.

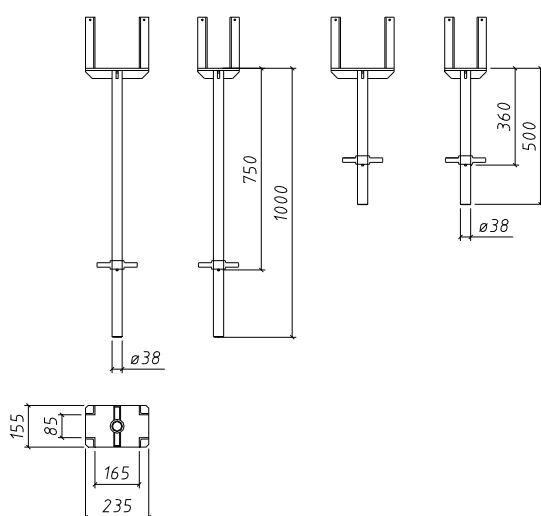

2.2.25. ADJUSTABLE HEAD

This item is used in shoring applications when joining scaffolding to formwork.

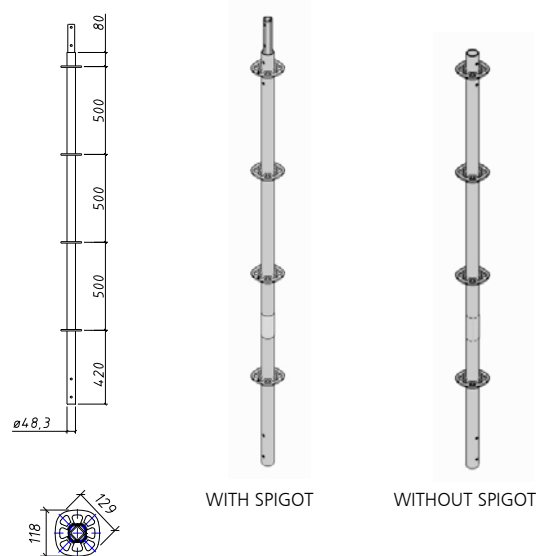

The adjustable head is composed of a 38 mm diameter solid bar with its corresponding nut and with a maximum adjustment of 350 mm for the 500 mm adjustable head and 750 mm for the 1m adjustable head. It has a welded plate with four L profiles at the four ends to fix the formwork.

2.2.26. STANDARD

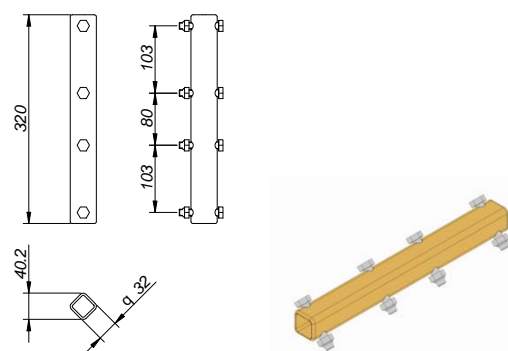

Structural item that transmits the loads supported by the scaffolding.

It comprises a steel tube with joint collars every 500 mm. The collars allow the horizontal and diagonal items to move in eight different directions. The standard can be finished with a spigot, allowing it to be linked with the following standard, or it can be finished without a spigot for an ending without obstructions. The existing dimensions are 0.5, 1, 1.5, 2 and 3 m.

2.2.27. DOUBLE SPIGOT

Item that can be bolted to a standard without spigot to convert it to a standard with spigot. It is bolted to the standard without spigot with two bolts.

2.2.28. DIAGONAL BRACE

Structural scaffolding item that ensures the bracing of the vertical and/or perpendicular planes to the front. It is also used for creating suspended structures.

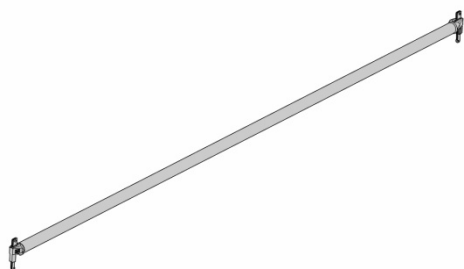

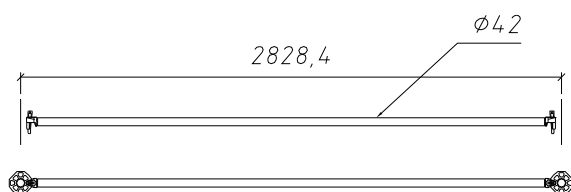

They comprise a tube with flattened ends and each has bolted on supports. Along with the wedges, they allow these to be fixed to the standards by means of the holes in the collars.

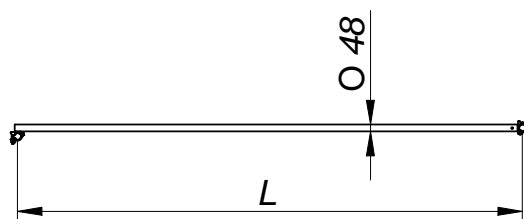

2.2.29. HORIZONTAL DIAGONAL

Scaffolding item that secures bracing on the horizontal plane.

The 2x2 horizontal diagonal has supports, each of which are welded to the ends, which together with the wedges allow these to be fixed to the standard collars.

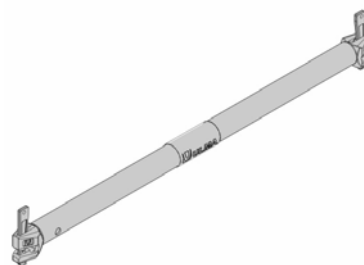

The other horizontal diagonals have semi-couplers at the ends instead of supports.

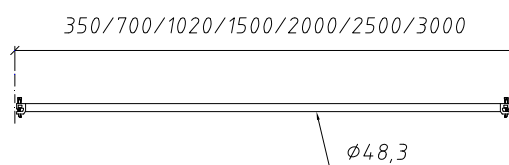

2.2.30. LEDGER

Structural scaffold component on the horizontal plane.

This can also be used as a safety handrail by placing two units at 0.5 and 1 m.

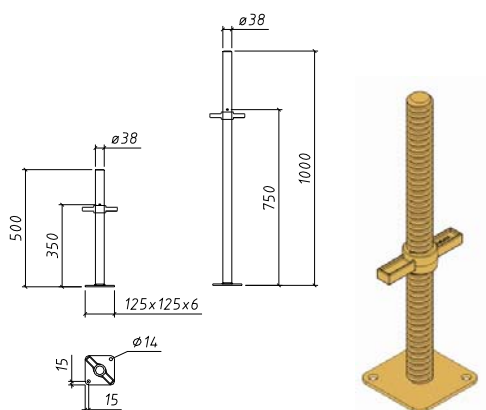

Casting supports are welded to the ends which, together with the wedges, allow them to be fixed to the standard by means of holes in its collars.

2.2.31. ADJUSTABLE BASE

This item's function is to level the structure, to adjust the required dimension and to transmit vertical loads produced in the scaffolding to the ground.

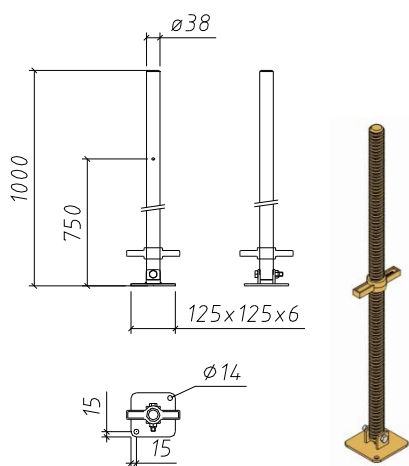

It has a nut for adjustment, upon which the base collar is supported and with which the scaffolding can be adjusted to the required height. The maximum adjustment are 0.75 m for the 1 m adjustable base and 0.35 m for the 0.5 m adjustable base.

2.2.32. ADJUSTABLE SWIVEL BASE

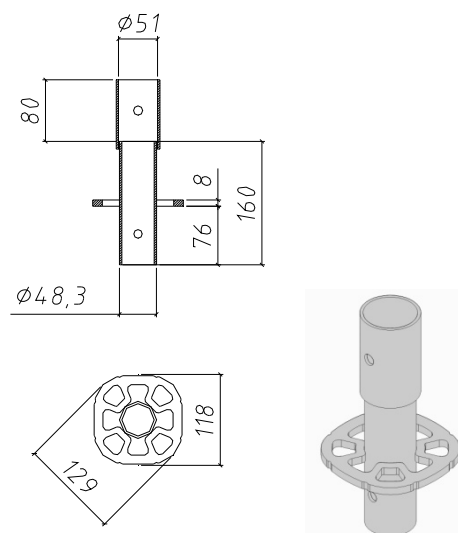

This item's function is to level the structure on surfaces with different slopes, to adjust the required dimension and to transmit vertical loads produced in the scaffolding to the ground.

The maximum adjustment is 0.75m.

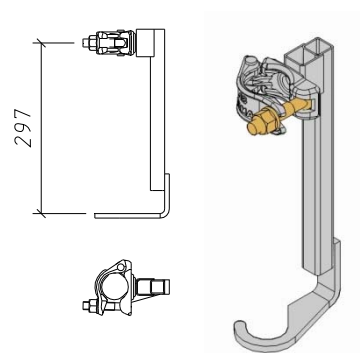

2.2.33. BASE COLLAR

Item that is placed directly over the nut of the adjustable base and to which the standards, ledgers and diagonals of the first level are joined.

2.2.34. HANDLE LOCK

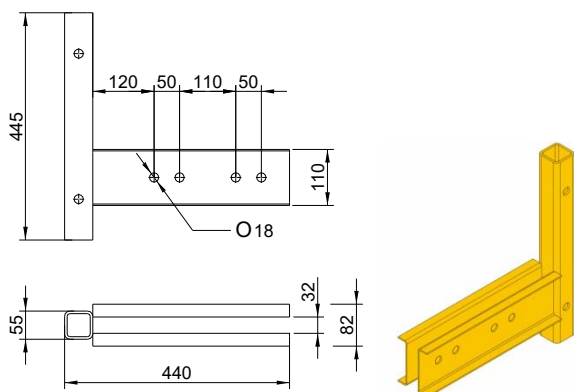

Item that is used to fix the adjustable base to the standard when scaffolding is lifted.

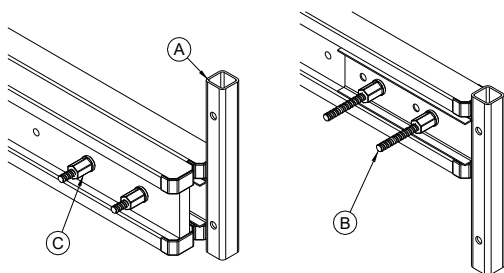

2.2.35. VM HANDRAIL SUPPORT

Safety accessory that is fixed to the timber beam and into which the safety handrail post is inserted.

This solution is certified by AIDICO in accordance with EN13374 with Handrail Post 1.5 (item number 2211156)

There are two possible assembly positions:

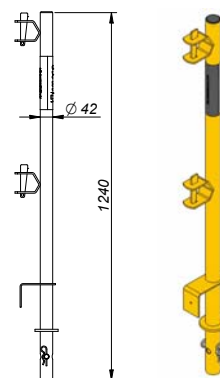

On the Main Beam

On the Secondary Beam

	QUANTITY	NAME	ITEM NUMBER
A	1	VM HANDRAIL SUPPORT	2211165
B	2	PANEL BOLT	1861122
C	2	HEXAGONAL NUT 15	7238001

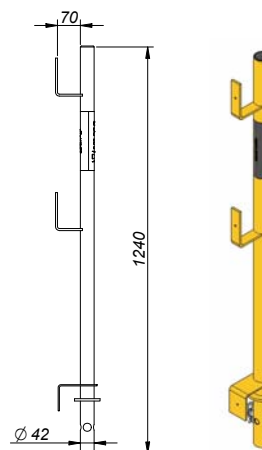

2.2.36. HANDRAIL POST S-V

When placed over a base frame, this forms the regulatory handrail with $\varnothing 42$ mm tubes and wooden plank for the toeboard.

2.2.37. SAFETY HANDRAIL POST

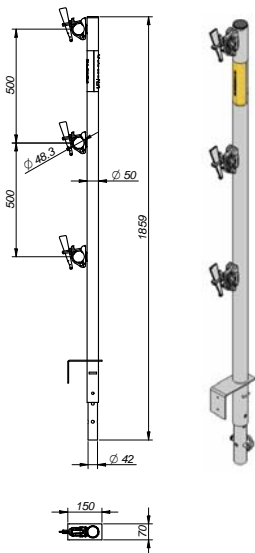

When placed over a base frame, this forms the regulatory handrail with wooden planks. The wooden plank is also used for the toeboard.

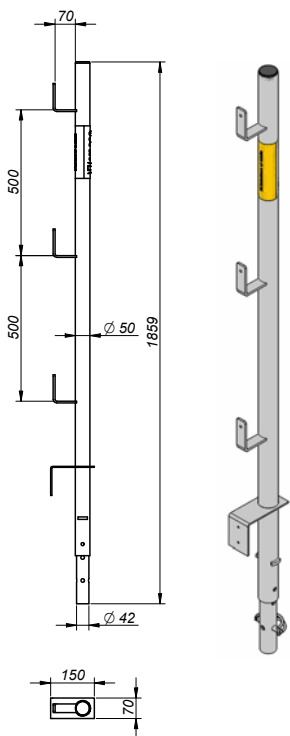

2.2.38. HANDRAIL POST 1.5-

HANDRAIL POST 1.5 WOOD

The 1.5 m Handrail Post placed over a base frame serves to form the regulatory handrail with a $\varnothing 48$ mm or $\varnothing 50$ mm tube and wooden plank for the toeboard.

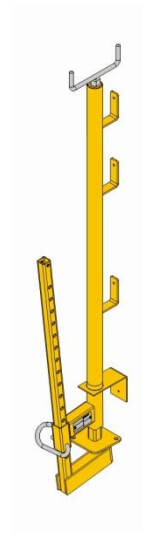

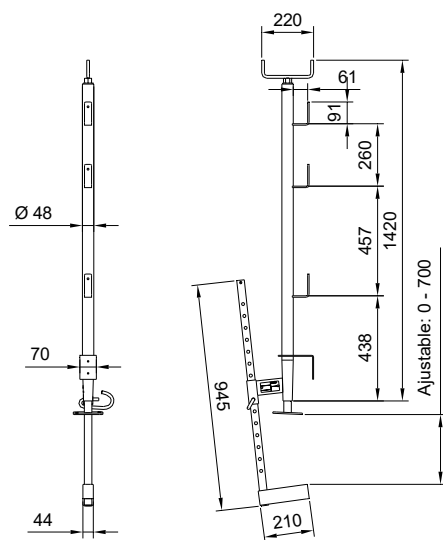

When placed over a base frame, the 1.5 m Handrail Post Wood forms the regulatory handrail with wooden planks. The wooden plank is also used for the toeboard.

2.2.39. CLAMP HANDRAIL 1.3

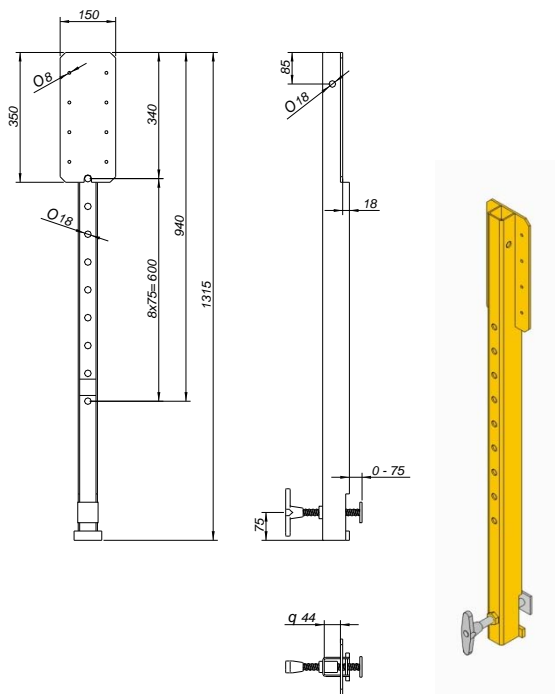

This is designed in accordance with EN13374.

The clamp is height-adjustable from 0 to 700 mm. It is used for the 30x150 mm European wooden plank and $\varnothing 48$ mm tube.

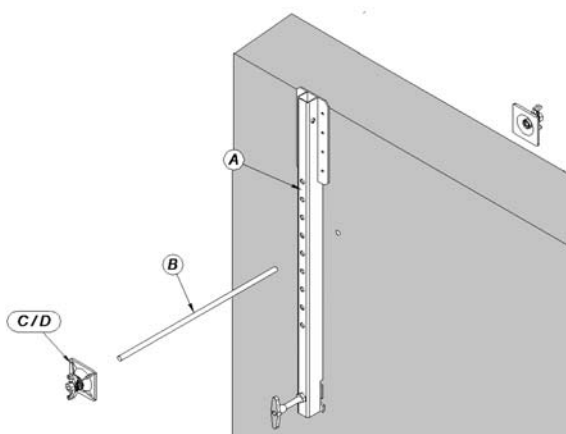

2.2.40. WALL HANDRAIL SUPPORT

Accessory for fixing a handrail to the outermost surface of an existing wall and/or to stopend the formwork.

It is fixed to the wall using the tie rod hole created during the concrete pouring for the wall, in the central part. To do this, a tie rod and two plate nuts are inserted into any of the $\varnothing 18$ mm holes spaced at every 75 mm, with the distance between the first and last hole being 600 mm.

	QUANTITY	NAME	ITEM NUMBER
A	1	WALL HANDRAIL SUPPORT	2211256
B	1	TIE ROD 15/1	0230100
C	2	PLATE WASHER NUT 15	1900256
D	2	PLATE NUT 15	7238000

The upper part of this item has holes for fixing the part to the board and the lower part has a threaded crank to put pressure on the board.

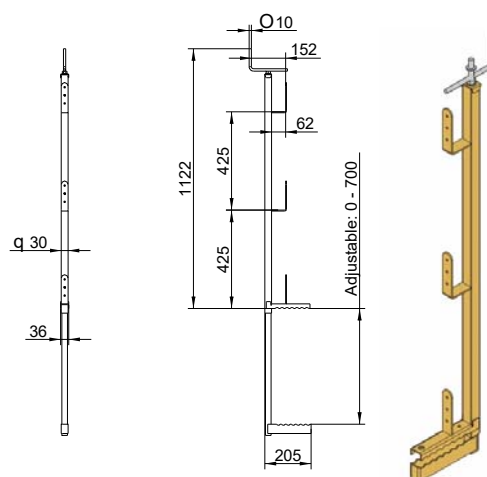

For more information, see the Wall Handrail Support User's Guide.

2.2.41. CLAMP HANDRAIL 1m

This is designed in accordance with EN13374.

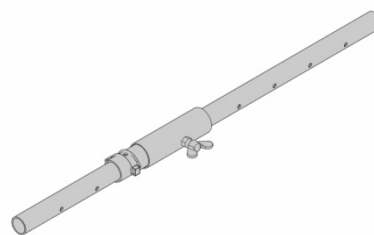

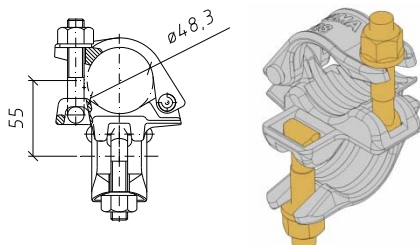

The clamp is height-adjustable from 0 to 700 mm. It is used with the 30x150 mm European plank.

2.2.42. RIGHT ANGLE COUPLER 48

Accessory for the orthogonal joining of two $\varnothing 48$ mm tubes.

It complies with standard EN 74-1 and is certified.

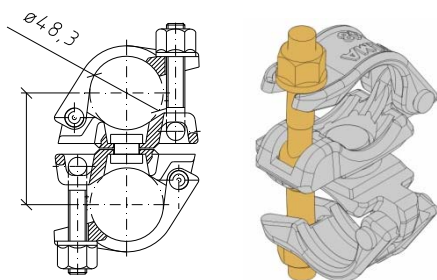

It is assembled by fixing and connecting the $\varnothing 55$ mm tube to the $\varnothing 48$ mm tube of the handrail ledger to be supplemented. Next the butterfly screw is tightened; once this has been done, the cotter pin is released and the 40 mm circular tube is extended until it is placed in the final position, when the cotter pin can be placed in its corresponding hole.

2.2.43. SWIVEL COUPLER 48

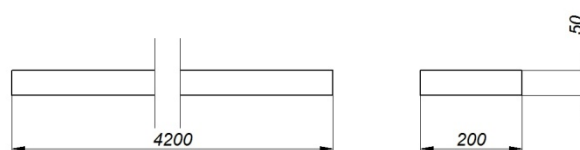

Accessory for joining two $\varnothing 48$ mm tubes at any angle.

It complies with standard EN 74-1 and is certified.

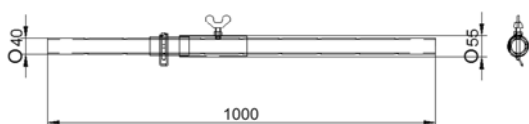

2.2.45. TOE BOARD 4000x200x50

This is a 4 m x 0.2 m x 0.05 m wooden plank with a quality of at least C-24 at in accordance with standard EN 338:2003. This is the standard toeboard that can be used in all edge protection systems.

2.2.44. EXTENDING LEDGER

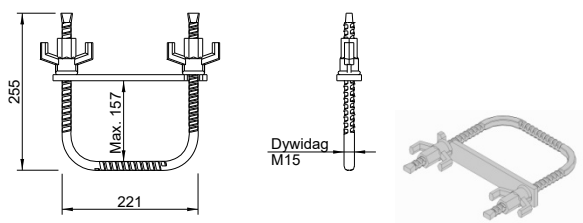

Removable handrail supplement for the $\varnothing 48$ mm tube, with which the handrail is supplemented, only exceptionally, up to 1 m extra (in 10 cm extensions).

2.2.46. PROP BRACING CLAMP

This stiffens and stabilises any ULMA Prop with wooden planks. It has a sheet and nuts for fixing.

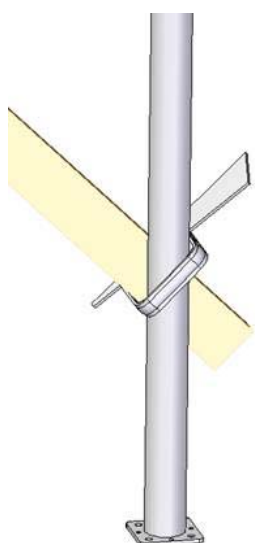

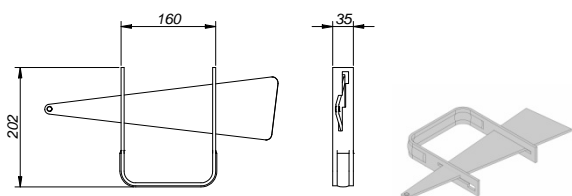

The maximum board thickness is 150mm.

For more information, see Instructions for Use of prop bracing clamps.

2.2.47. CLAMP SP-EP

This stiffens and stabilises ULMA SP and EP Props with wooden planks. It has a wedge for fixing. The maximum board width is 120mm.

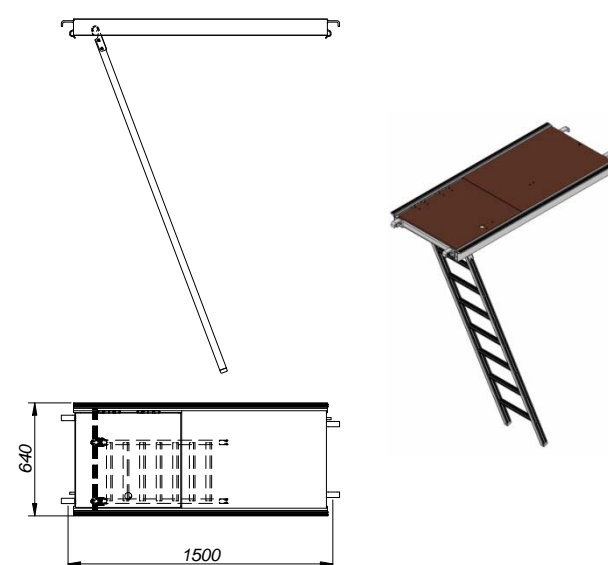

2.2.48. TRAPDOOR PLATFORM 1.5

This is a working platform for workers. It allows vertical access to the structure thanks to the built in ladder and trapdoor.

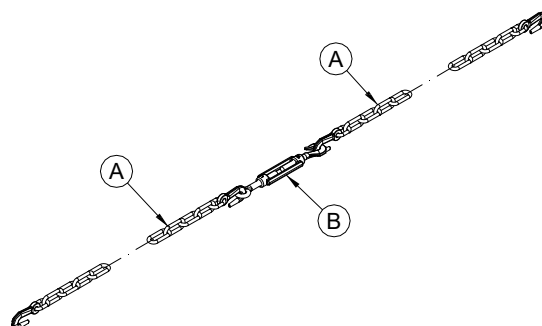

The wooden surface is class 3 fire resistant.

The 1.5 trapdoor platform is class 6 (600 daN/m²) in accordance with EN12811-1.

2.2.49. CHAIN VR 7.5 kN

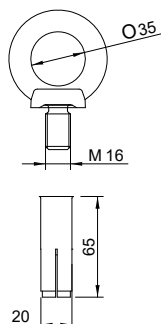

This is an anchoring system to prevent overturning. It is formed by two metal chains (DIN 763) with two hooks at the ends of each chain. These chains are joined by means of an M-12 hook-type push-pull prop and ring (DIN 1480).

	QUANTITY	NAME	ITEM NUMBER
A	2	CHAIN DOUBLE HOOK	2211751
B	1	EYEBOLT/HOOK PUSH-PULL PROP M/14	9371857

Includes:

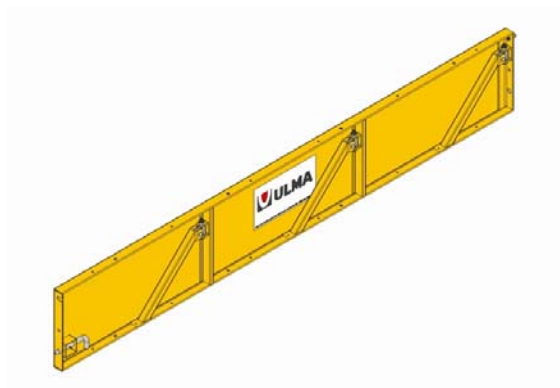

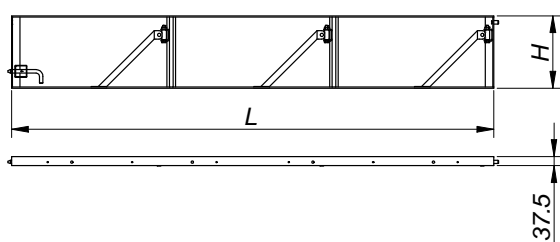

- Eyebolt Screw M16 (item number 9165400).
- HKD HILTI Plug M16 (item number 9850530).

For more information see VR Chain instructions for use.

2.2.50. STOPEND

Steel structure for making slab edges. This is composed of a steel structure with a frame shape to which reinforcements have been welded and to which legs have been joined to support loads from the pressure of the concrete.

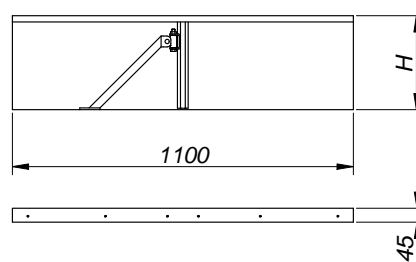

NAME LxH	ITEM NUMBER
STOPEND B 1x0.3	1860676
STOPEND B 2x0.3	1860690
STOPEND B 1x0.4	1860696
STOPEND B 2x0.4	1860705

For more information, see the Stop-ends User's Guide.

2.2.51. FILLER STOPEND

Reinforced sheet to compensate the dimensions of the slab boards that are made with the stopend. The maximum compensation possible is 1m.

NAME	ITEM NUMBER
Filler stopend 0.3	1860676
Filler stopend 0.4	1860696

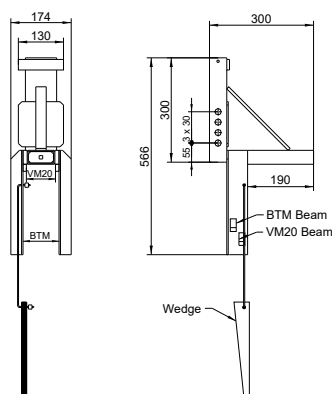

The reinforced sheet has a central reinforcement welded to an articulated leg that allows the plumbing of the stop-end and supports the pressure of the concrete.

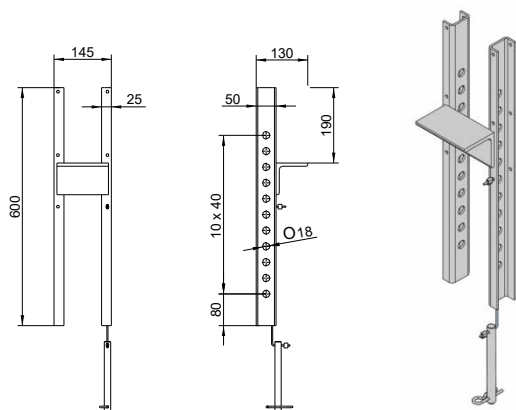

For more information, see the Stopends User's Guide.

2.2.52. VM HANGING BEAM SUPPORT AND VM20 HANGING BEAM SUPPLEMENT

Items for making hanging beams and slab edges. They are designed for VM 20 beams.

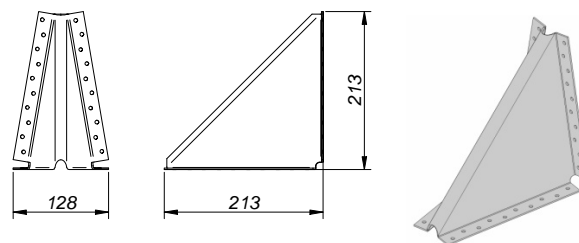

The VM 20 hanging beam supplement is an accessory to combine with the support for hanging beams up to 90 cm.

For more information see the User's Guide
VM 20 HANGING BEAM SUPPORT.

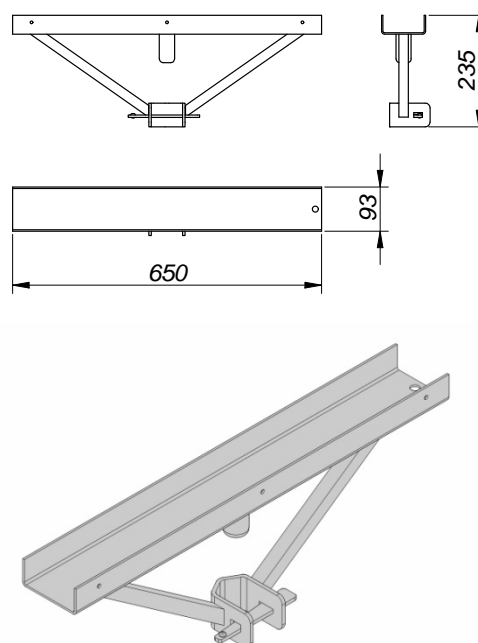

2.2.53. STOP-END CORNER

Steel item for making slab edges. It is nailed to the formwork.

2.2.54. CROSS PROP

Steel item for using with hanging beams.

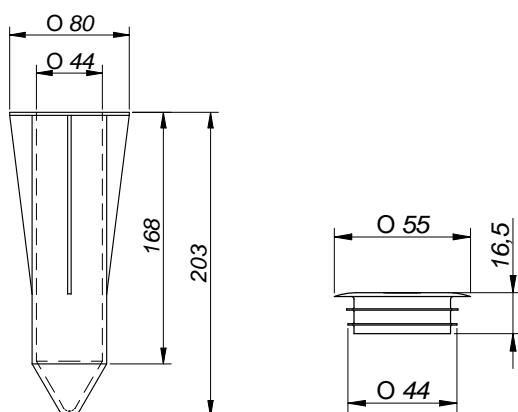

NAME	ITEM NUMBER
Cross Prop SP-30	2170365
Cross Prop SP 35-40	2170360

The difference between the two cross braces is the tie clamp. The SP-30 prop cross brace has a narrower clamp to tie to the SP-30 prop tube (Ø45). And the SP 35-40 cross brace is for use with the SP-35 prop (Ø54) and the SP-40 prop (Ø54).

2.2.55. PLUG 42 AND PLASTIC PLUG

These are two parts which are assembled together in the fresh concrete as sockets for the positioning (after the concrete has set and the plug has been removed) of the handrail post as edge protection.

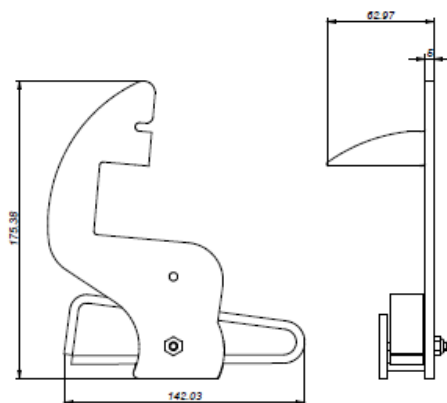

The plug 42 has been tested with the 1.5m Handrail Post and the set complies with the requirements of EN 13374.

2.2.56 CLAMP VM-VM

Fixing and stabilising element of two VM20 placed perpendicularly for horizontal or overturned formwork (up to 20°).

Replaces nails and prevents damage of the VM20.

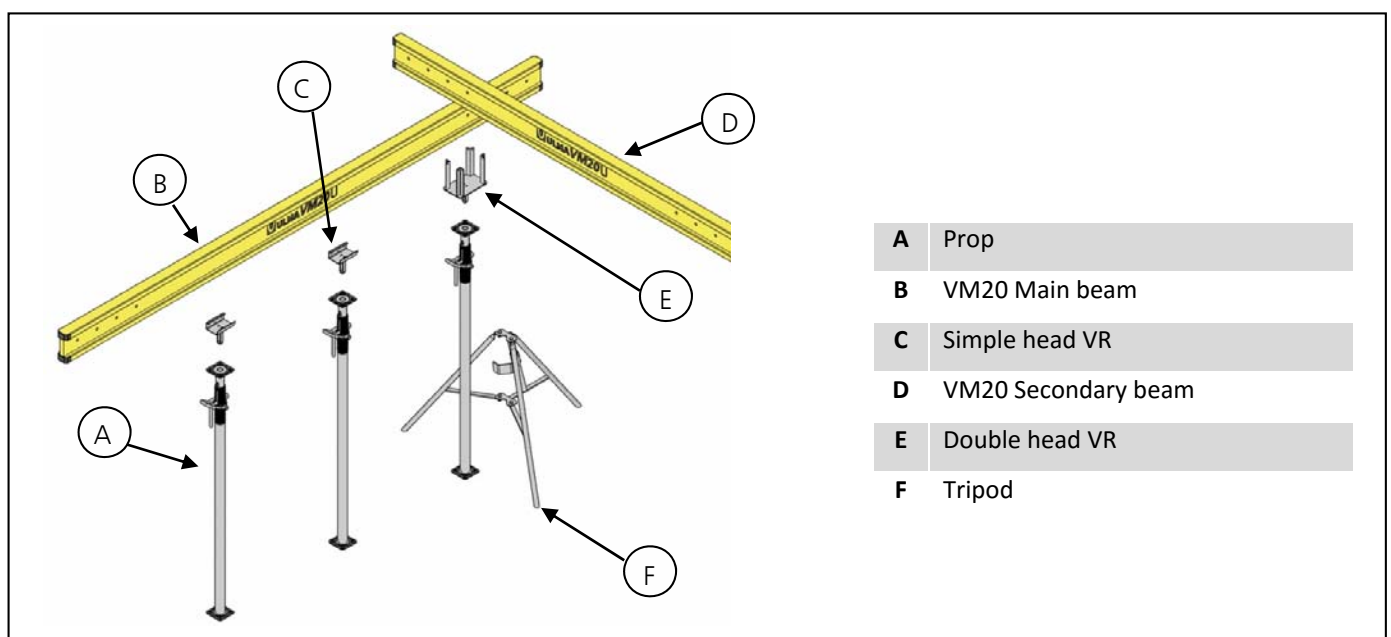

3. ASSEMBLY, USE AND DISMANTLING

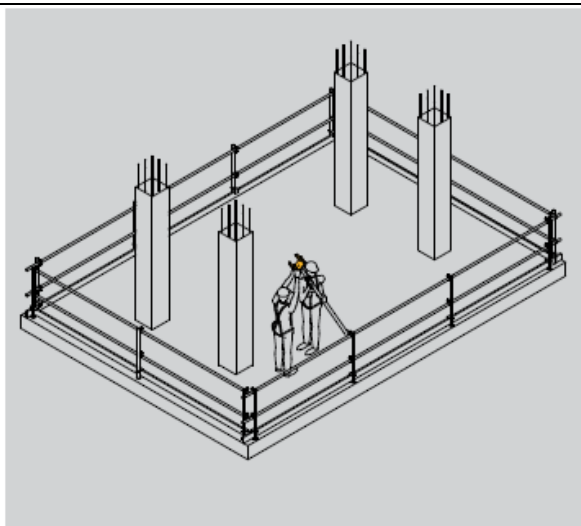

3.1. BASIC ASSEMBLY

The basic assembly of the ENKOFLEX system comprises VM 20 beams forming a double arrangement, resting on double head VR and simple heads VR. The board rests on the VM 20 secondary beams.

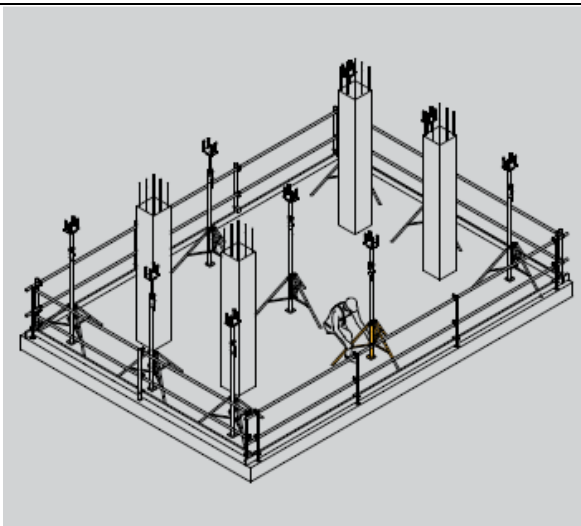

The double heads are assembled at the beginning and at the end of each main beam, on the overlaps of the VM 20 main beams.

The props that go on the double heads VR are assembled with tripods to provide the system with stability.

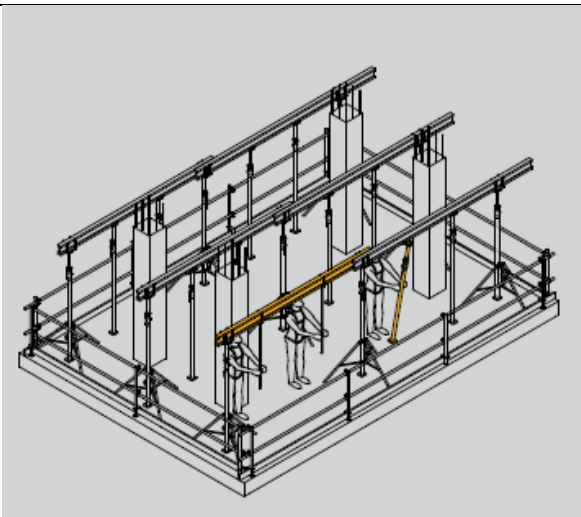

1. Insert the Head into the top part of the Prop.

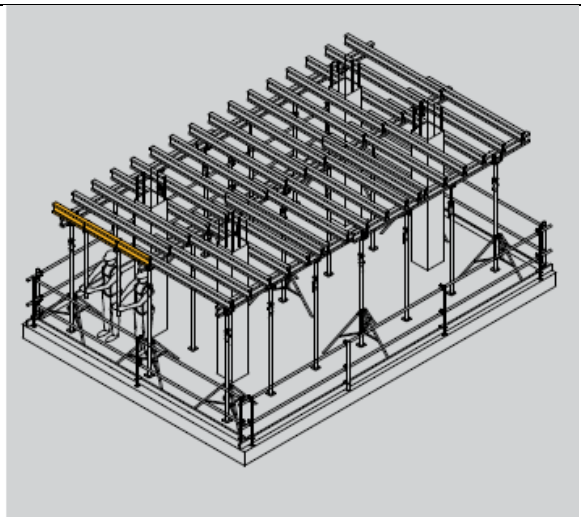

2 Make a layout of the main beams following the drawing. Position the props, stabilised by means of tripods, following these layout lines.

3. Place the main beams, propping up each one of them with two props at the ends and double heads. Stabilise them using the tripods. Place the intermediate props with the simple head.

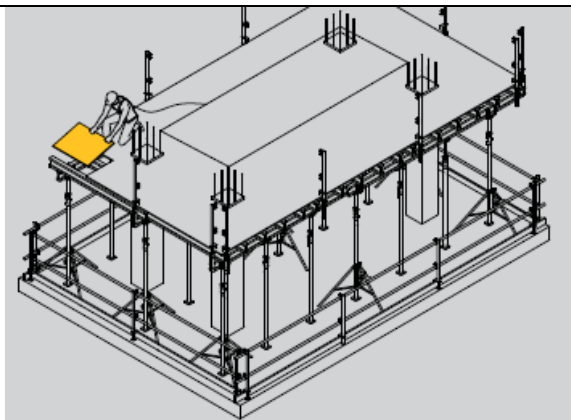

The main beams are assembled with the help of specific items, or by auxiliary equipment if these are not available.

4. Space the secondary beams at the distance indicated in the assembly drawings.

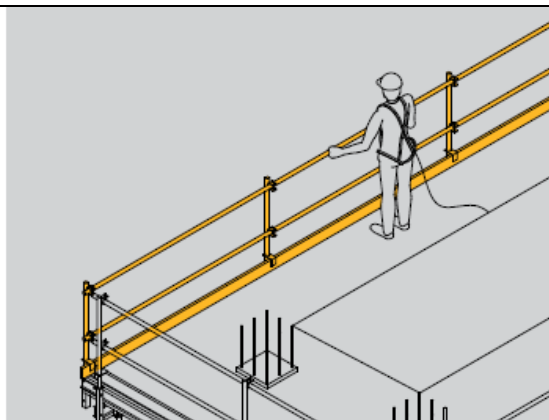

The same auxiliary equipment is used for the assembly of the secondary beams as for the main beams.

5. Place the boards in a secure manner.

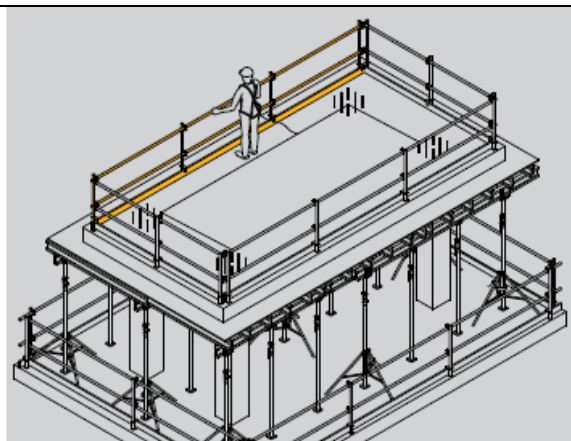

At all times the worker should remain tied from the securing shackle of the harness to the life lines installed between the columns or use auxiliary equipment.

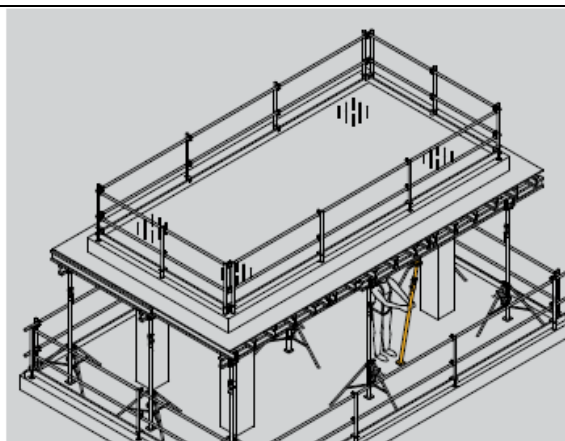

6. Close the perimeter by means of handrails and toeboards.

3.2. BASIC DISMANTLING

Stripping should always be carried out from the centre of the span towards the ends. Equally, in the case of the cantilevers, stripping should begin at the end of the cantilever towards the interior. Based on the construction time scales, layout of the formwork, slab thickness and free height, the falsework should be removed when the slab is able to support the forces to which it is submitted, beginning from the central props towards the columns.

1. Remove the perimeter protection and place it on the prepared forged slab.

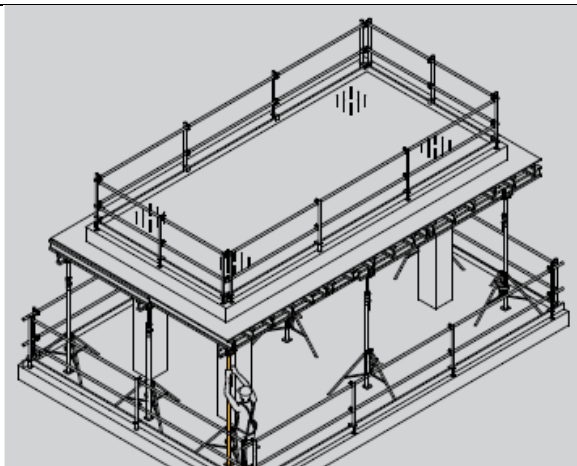

2. Then unload the intermediate props with the simple heads.

Study the stripping process to avoid overloading the props.

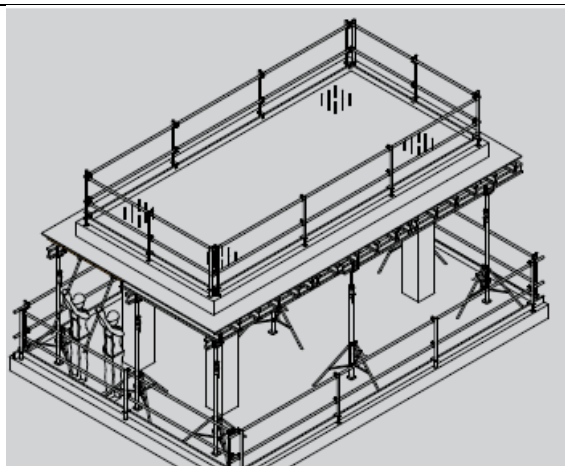

To remove the props, you do not need to completely remove the simple head from the prop. Loosening it and turning it sideways will suffice.

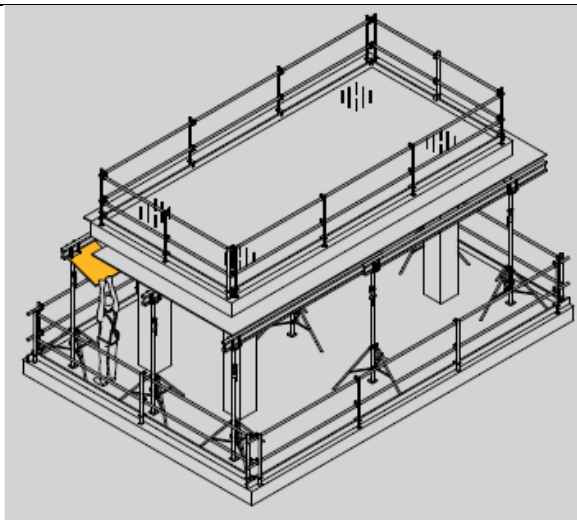

3. Loosen the remaining props by approximately 5 cm so that the main beams descend.

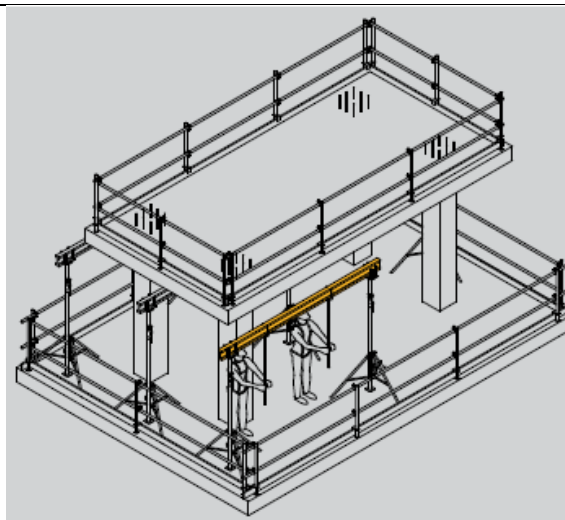

Take the necessary precautions to avoid items falling.

4. Lay the secondary beams over the main beams to take them out, leaving those that go in the panel connections.

5. Remove the panels along with the secondary beams that they are shored on.

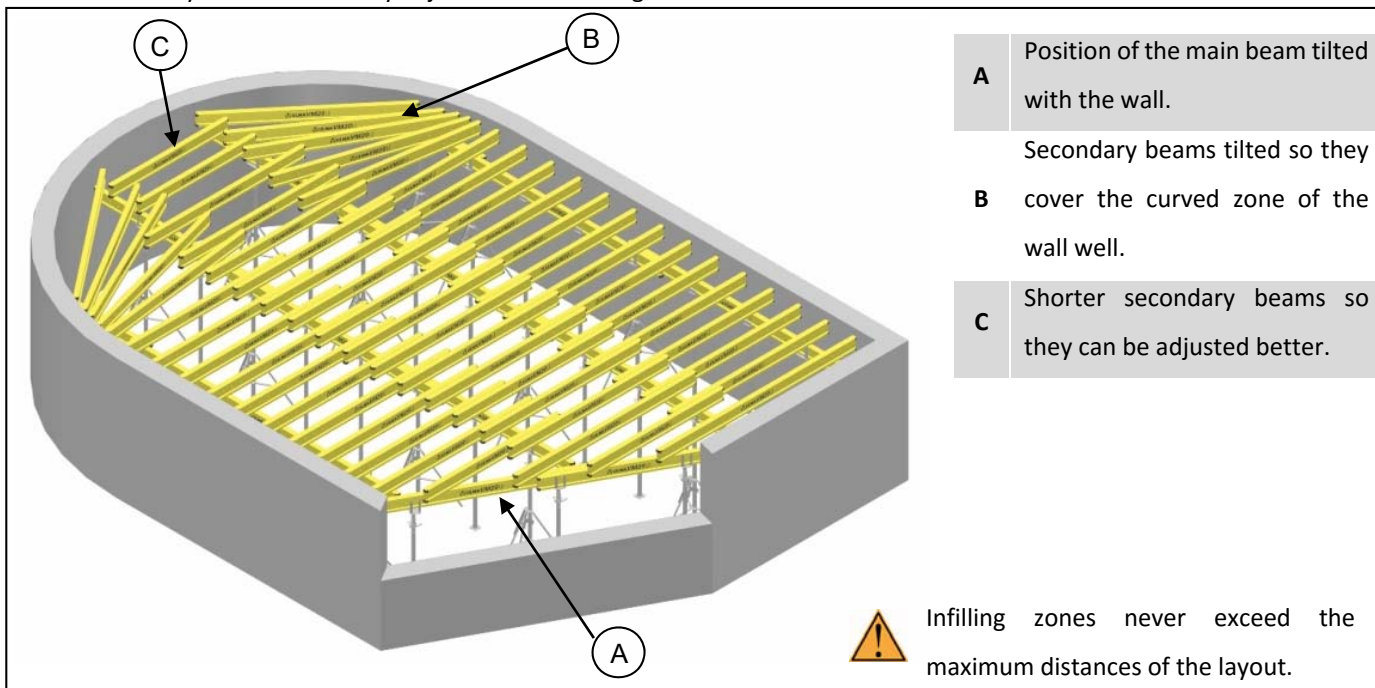

6. Finish dismantling the rest of the formwork: main beams, props, double heads and tripods.

4. SOLUTIONS

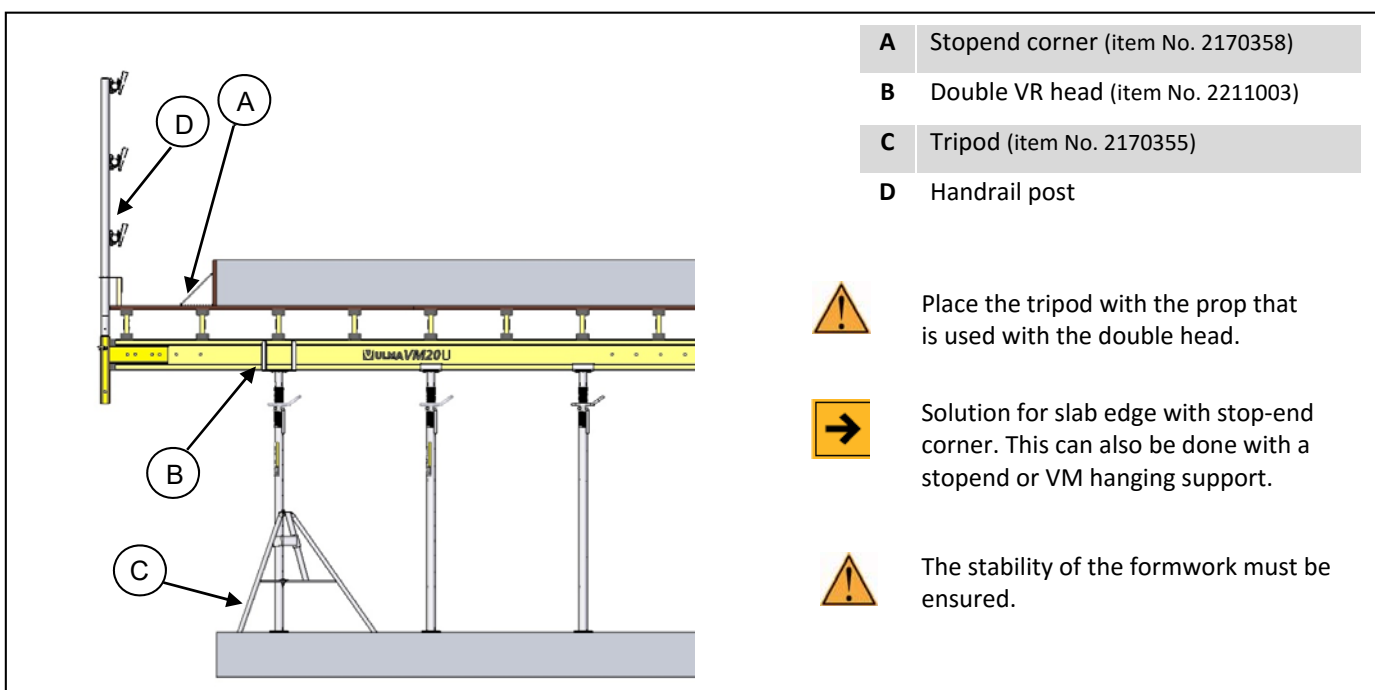

4.1. FLEXIBLE SYSTEM

The ENKOFLEX system can be easily adjusted to different geometries.

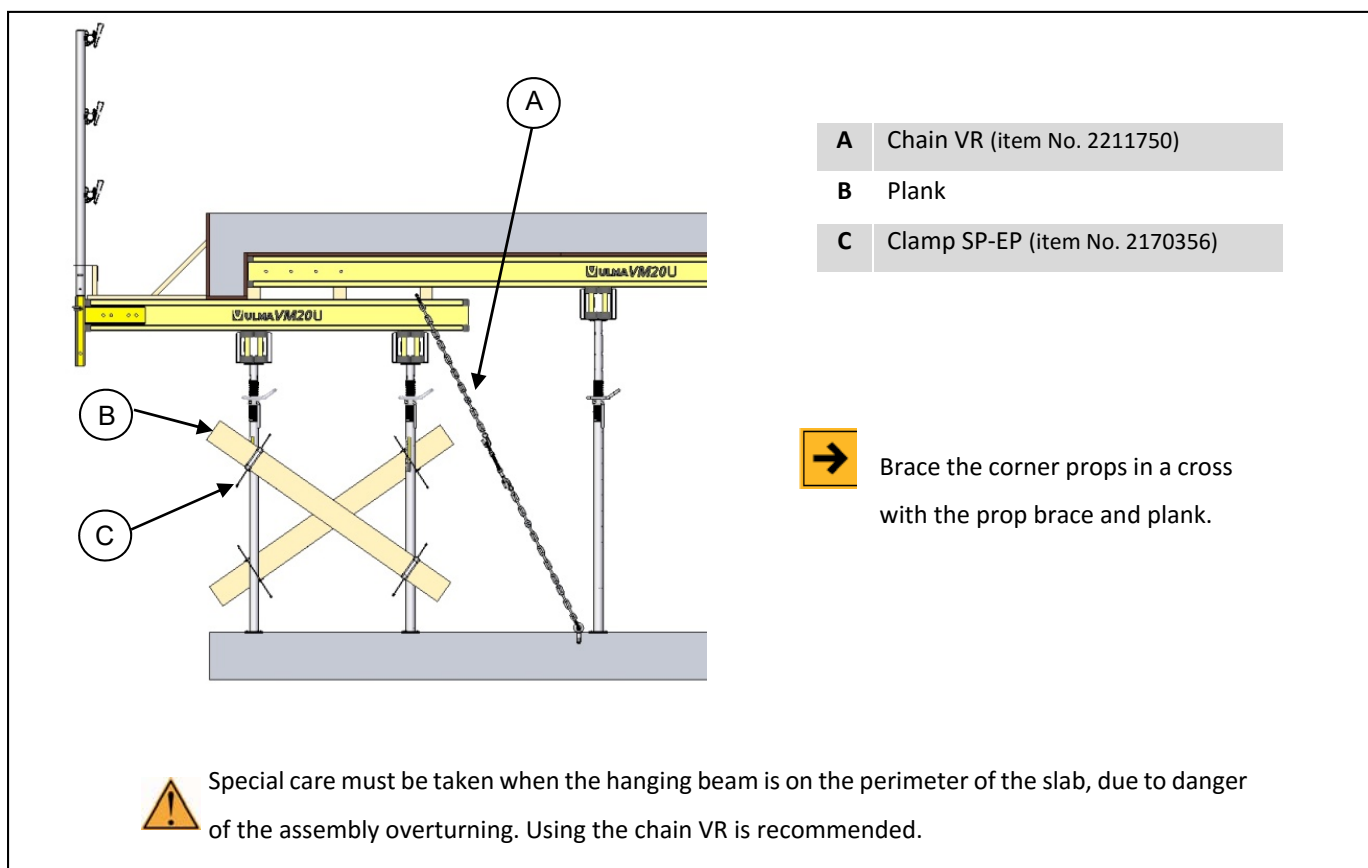

4.2. SLAB EDGE SOLUTIONS

4.2.1. WITHOUT HANGING BEAM

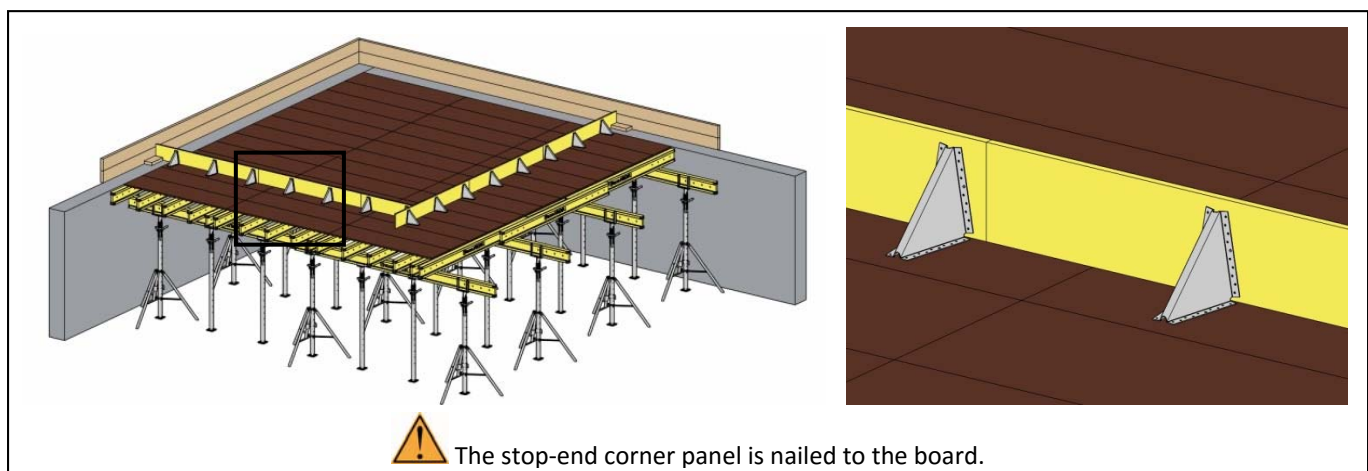

4.2.2. WITH HANGING BEAM

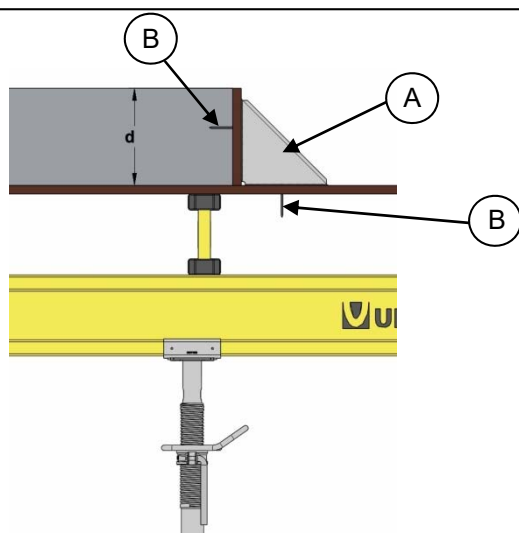

The VR chain is attached to the slab by means of a ring or bolt previously placed in the slab. It has a length of 5.2 m and a load-bearing capacity of 7.5 kN.

4.3. STOP-END SLAB SOLUTION

4.3.1. WITH STOP-END CORNER

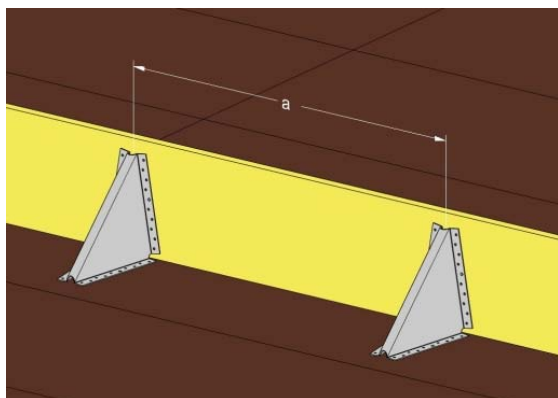

Maximum slab thickness of **30 cm**

- | | |
|----------|------------------------------------|
| A | Stop-end corner (item No. 2170358) |
| B | Nail $\varnothing 4.3$ |

Permissible differences between stop-end corner panels:

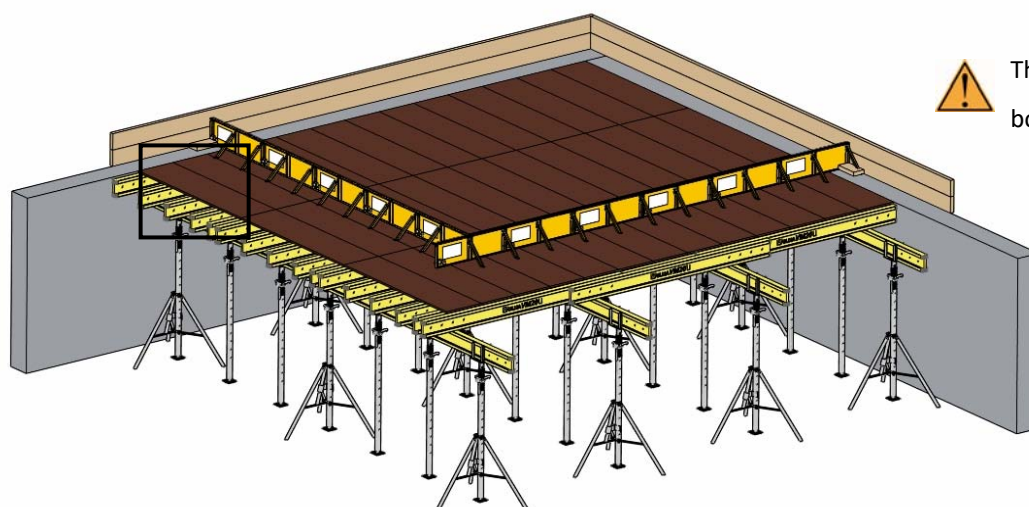

Maximum width of influence
'a' with slab thickness [m]

	0.2	0.25	0.3
Four units $\varnothing 4.3\text{mm}$ nails	2	1.8	1.6

4.3.2. WITH FILLER STOPEND

To achieve the desired slab edge length, there are different stop-end dimensions as well as the compensating stop-end. The maximum compensation length of the compensating stop-end is 1m.

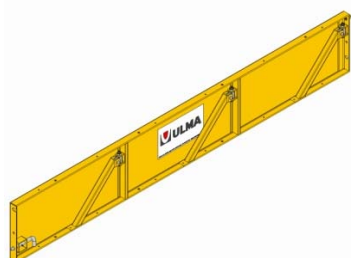

The stopend is nailed to the board.

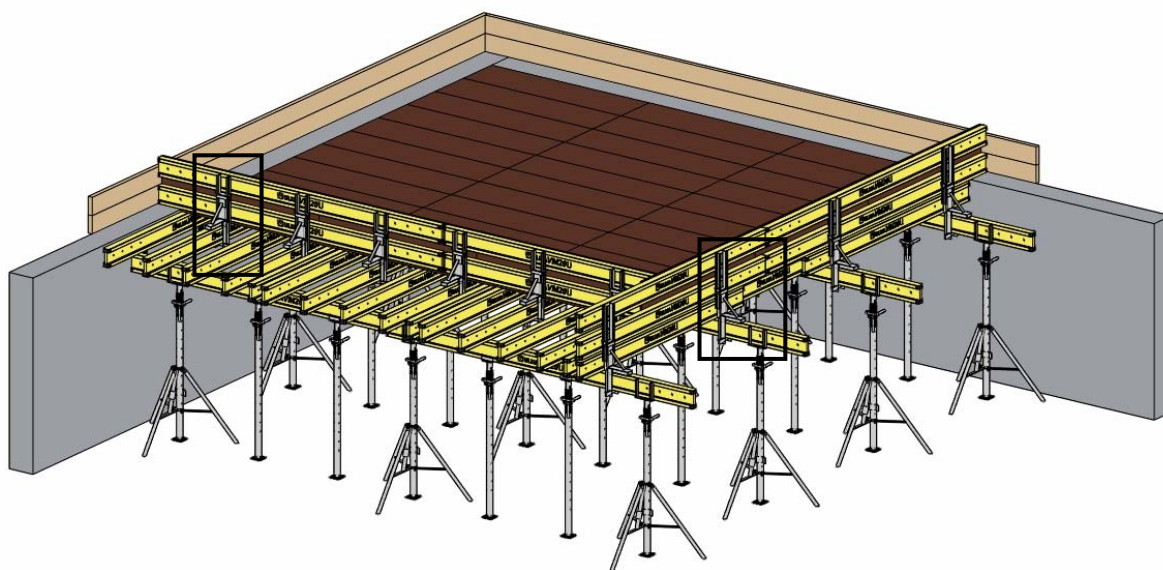

- A** Fix to the wood
- B** Positioning of the panels using integrated pin.
- C** Fixing the panels
- D** Wooden block to secure the position of the last stopend

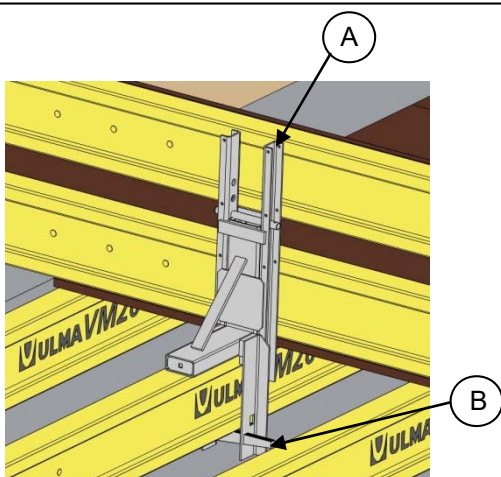

The maximum possible slab thickness is 30 to 40cm, depending on the stopend.

ITEM NUMBER	NAME	MAXIMUM SLAB (cm)
1860676	Stopend B 1x0.3	30
1860690	Stopend B 2x0.3	30
1860696	Stopend B 1x0.4	40
1860705	Stopend B 2x0.4	40

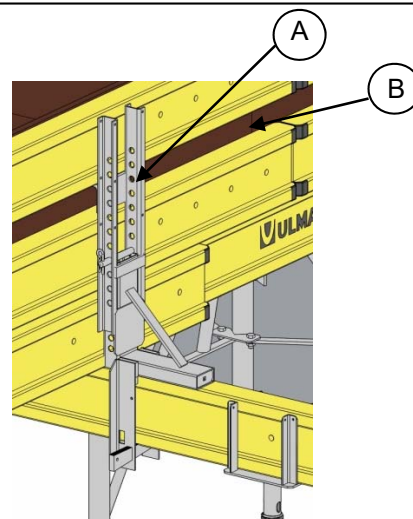

4.3.3. WITH HANGING BEAM SUPPORT

A Fix the VR hanging beam support (item No. 2211670) to the wood.

B Fixing the Hanging Beam Support with wedge

A The beam supported by the VM20 Hanging Beam Supplement (item No. 2211660)

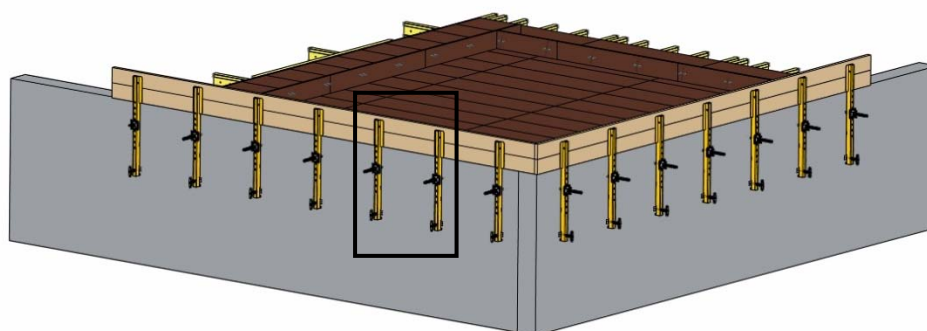

B Board fixed to the beams

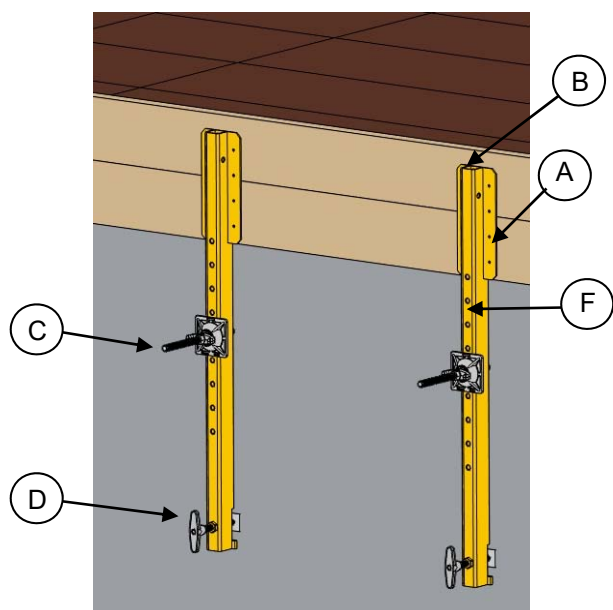

For more information see features chapter

4.3.4. WITH WALL HANDRAIL SUPPORT

The wall handrail support is fixed to the wall, the holes that were made when the wall was concreted may be used to stopend the formwork or fix a handrail to the outermost surface of an existing wall.

- | | |
|----------|---|
| A | Fix the wall handrail support (item No. 2211256) to the wood. |
| B | Hole to insert the safety handrail |
| C | Fixing with tie rod and two nuts |
| D | Threaded handle to fix it to the wall |
| F | Ø18mm holes spaced at 75mm |

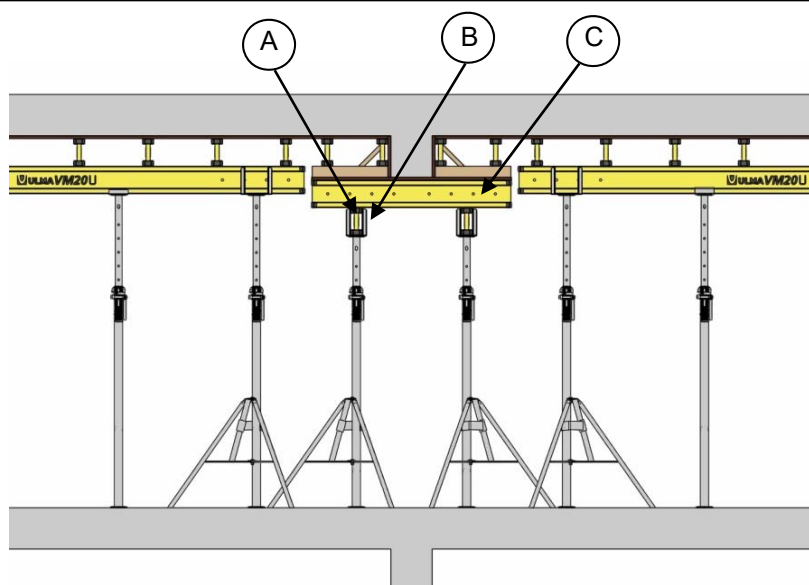

For more information see features chapter

4.4. HANGING BEAM

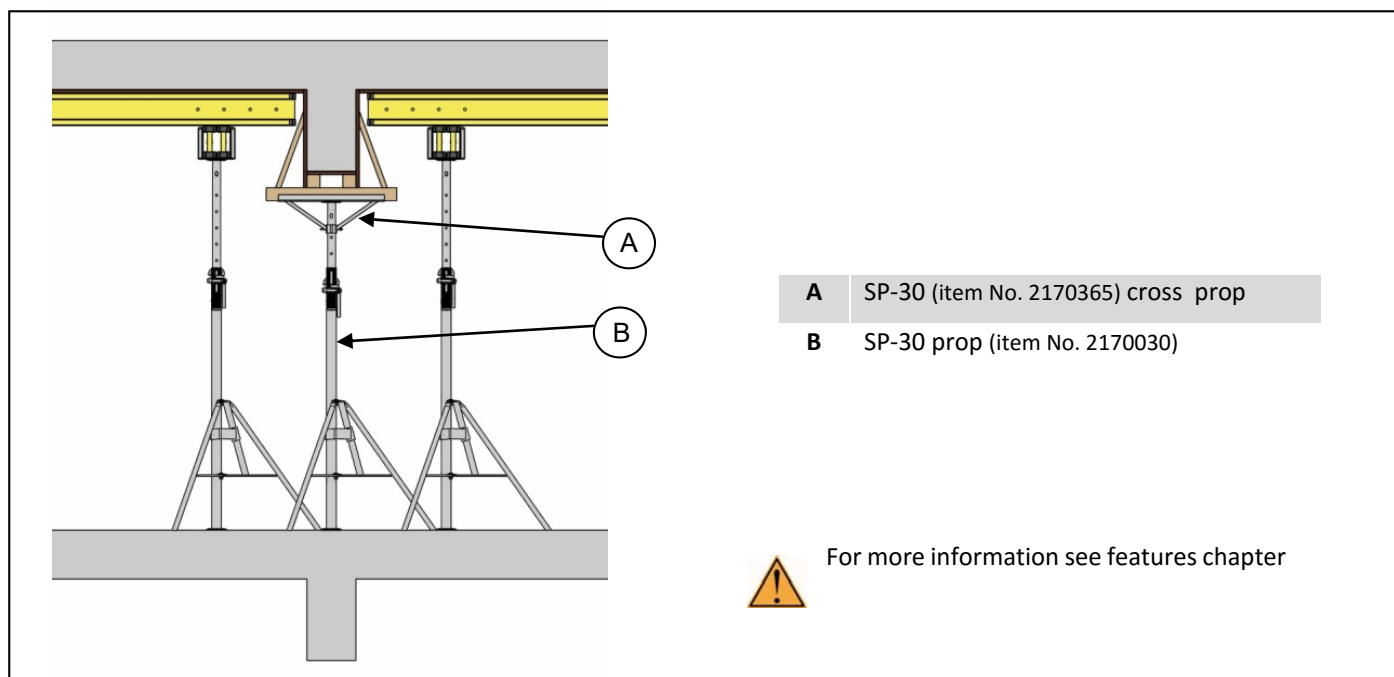

To shore the hanging beams, the main beam is placed longitudinally to the beam, and the secondary beams are supported on these.

4.4.1. WITH TIMBER BEAM

- | | |
|----------|-------------------|
| A | Main VM beam |
| B | Double VR head |
| C | Secondary VM beam |

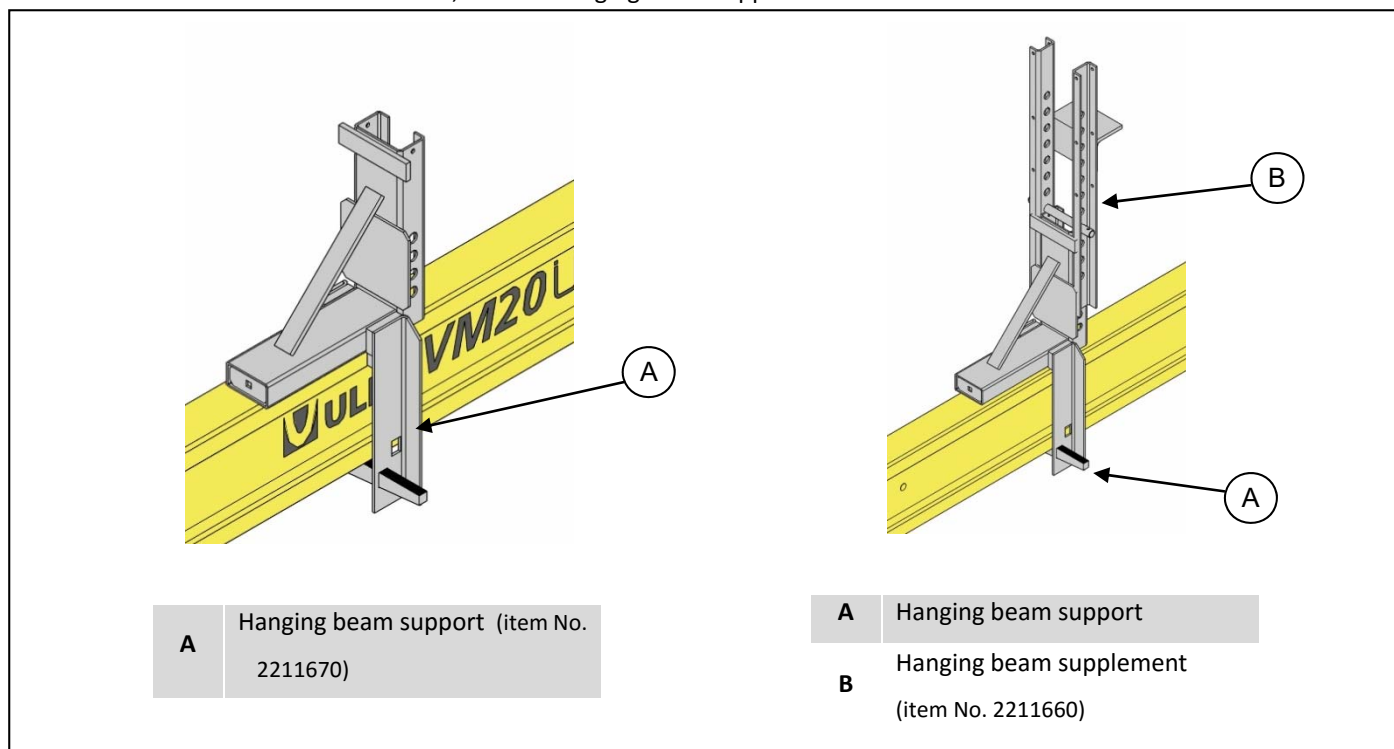

4.4.2. WITH CROSS BRACE PROP

4.4.3. WITH HANGING BEAM SUPPORT

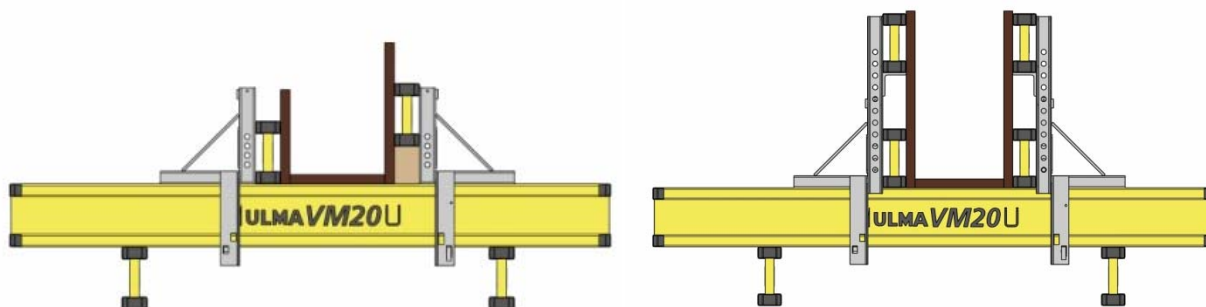

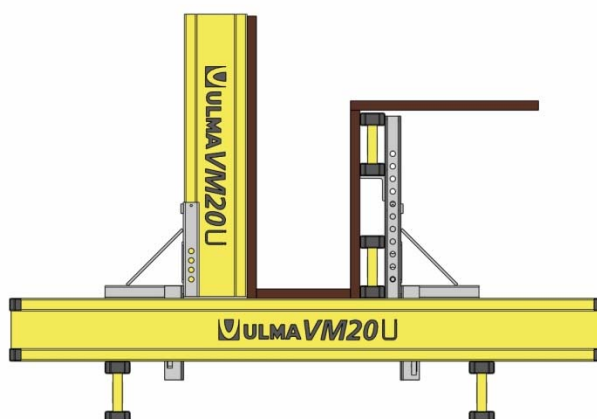

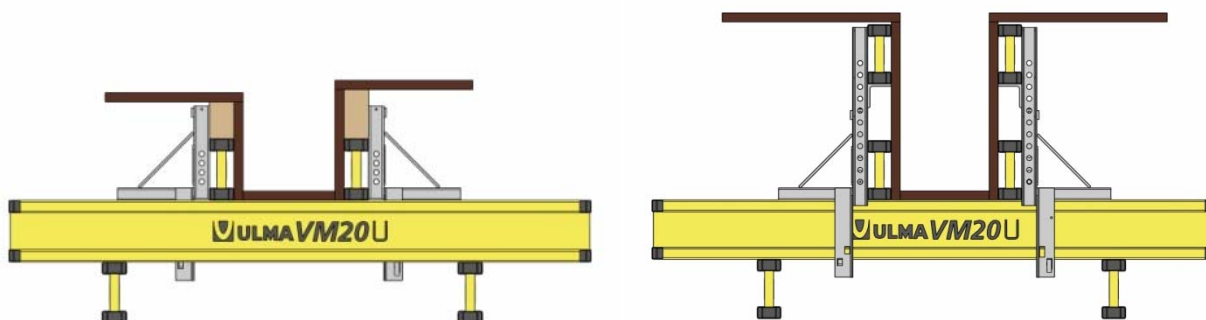

The construction of the hanging beam can be carried out with the hanging beam support for slabs of up to 40 cm. The hanging beam support is placed on the VM 20 timber beam, making it possible to stopend the sides and it is fixed with the wedge.

For slabs of between 40cm and 90cm, add the hanging beam supplement.

ASSEMBLY EXAMPLES

The following structures are only recommendations, other configurations are possible.

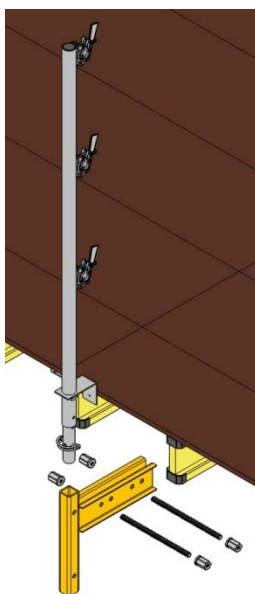

****Hanging beam solution*******Hanging beam and slab edge solution*******Hanging beam and slab solution***

For more information see features chapter

4.5. PERIMETER PROTECTION

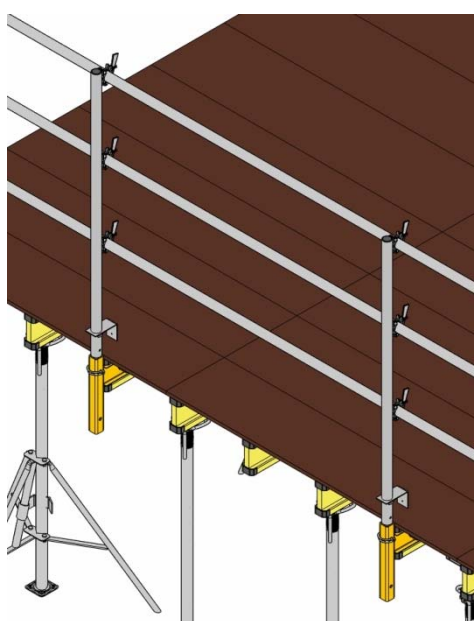

4.5.1. HANDRAIL SUPPORT

The handrail support acts as support for placing the front and side handrails. It can be mounted over the main beam, as well as over the secondary beam.

The handrail support is fixed with a $\varnothing 14\text{mm}$ pin and another cotter pin in R-3 to the timber beam. The safety handrail is inserted into the vertical tube of the support. The safety handrail, except for the clamp handrail, has an L sliding element on the bottom part for placing the toeboard.

On the other side, ledgers are used to protect the perimeter of the slab. These are horizontal elements formed by tubes or planks, and are fixed to the safety handrail by means of clamps with wedges.

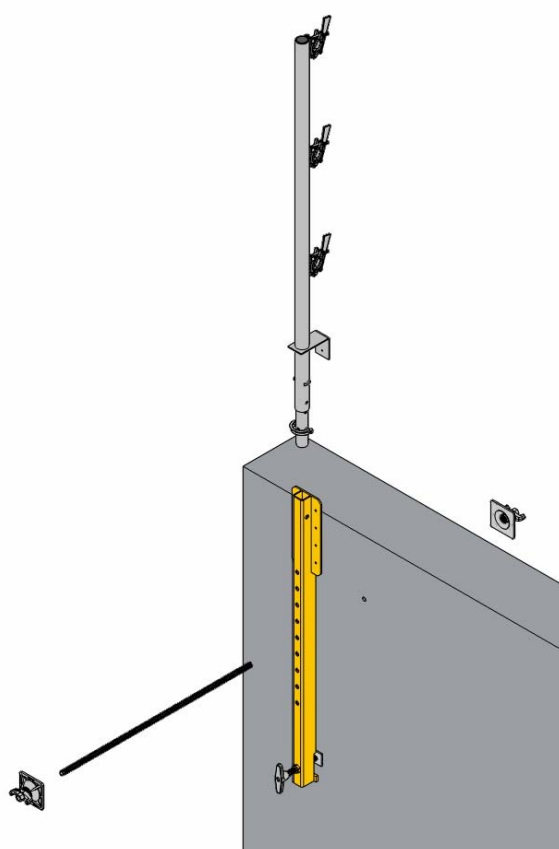

4.5.2. WALL HANDRAIL SUPPORT

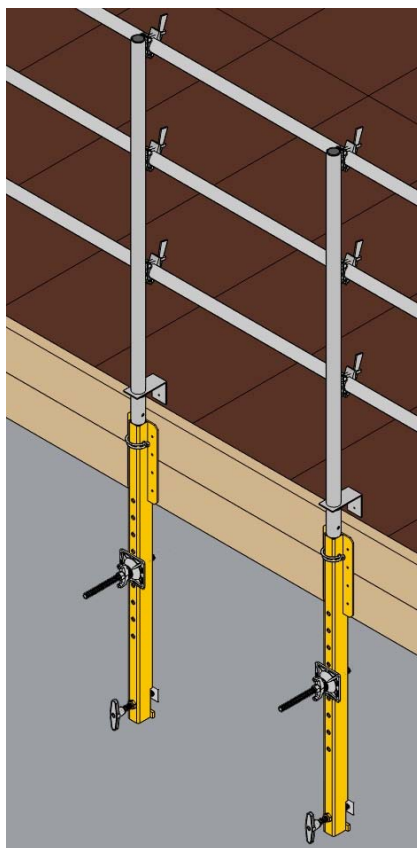

Used for fixing a handrail to the outermost surface of an existing wall and/or to stopend the formwork.

To fix this item to the wall, the tie rod hole created during the concrete placement of the wall is used. To do this, a tie rod 15 and two plate nuts are inserted into any of the $\varnothing 18$ mm holes spaced at every 75 mm, with the distance between the first and last hole being 600 mm.

A wooden block is used to stopend the formwork and/or toeboard and is nailed to the upper plate. Thanks to the levelling device, any type of wood can be used as long as the thickness is greater than or equal to 18 mm.

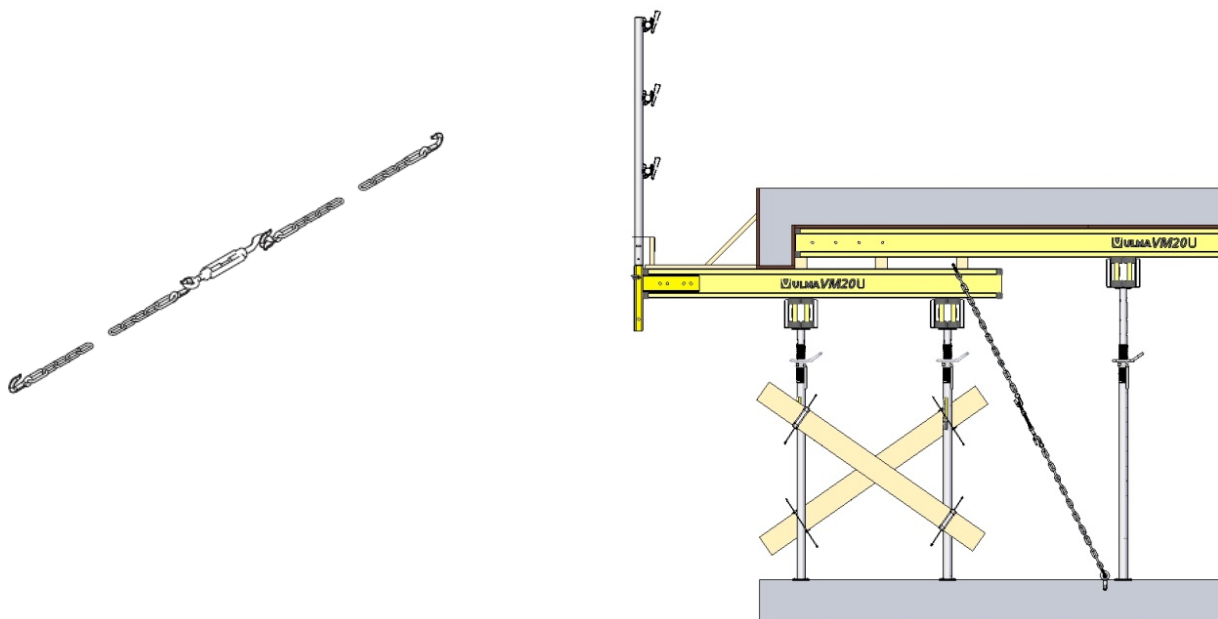

The handrail is inserted into the profile in a U shape and is fixed with a cotter pin. Any of the ULMA 1 m and 1.5m handrails can be used with both tubes and planks with the wall handrail support.

4.5.3. CHAIN VR

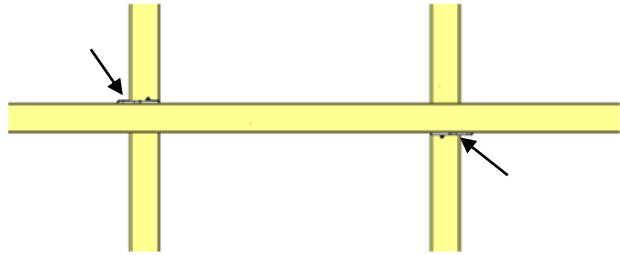

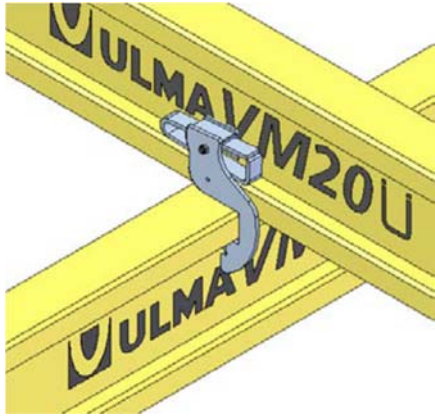

Item used to tie the ENKOFLEX system VM 20 beams (especially the cantilever beams) to the slab and so avoid the possibility of them tilting towards the exterior and being lifted by strong gusts of wind.

The VR chain is attached to the slab by means of a ring or bolt previously placed in the slab. It has a length of 5.2 m and a load-bearing capacity of 7.5 kN.

4.6 CLAMP VM-VM

Place a minimum of two CLAMP VM-VM per beam. If the superior beam rests over more than one beam, place the CLAMP VM-VM in parallel rows.

5. FEATURES

Calculation example:

1 Slab thickness selection

2 Selection of distance of secondary beams (according to the table)

3 Determine: Maximum distance between main beams

4 In the indicated row, select a distance between main beams less or equal to that indicated in step three.

5 Determine the maximum distance between props and the prop load.

Prop distances
Prop load

SB: Secondary beam
MB: Main beam

CALCULATION EXAMPLE	
1	Slab thickness
2	Board and SB selection
3	Maximum MB distances
4	Determine MB distances
5	Maximum distance between props + prop load

5.2. PROPS

5.2.1. SP PROP

SP props - working load (kN)				
Height (m)	SP-30	SP-35	SP-40	SP-50

4.60								20.00
4.70								20.00
4.80								20.00
4.90								20.00
5.00								20.00

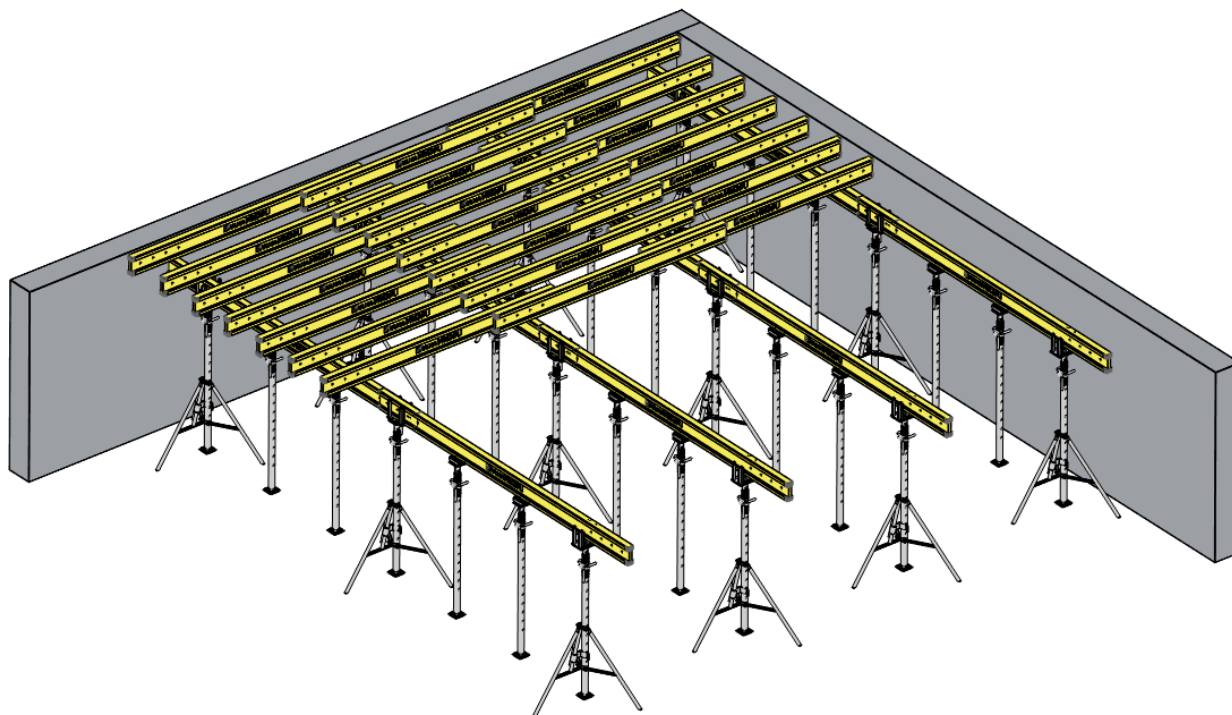

INNER TUBE ABOVE

5.3. STABILITY AND BRACING OF THE SYSTEM

5.3.1. STABILITY DURING THE ASSEMBLY

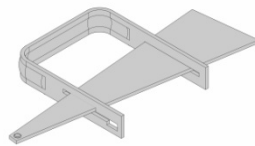

A tripod must be placed for each double head to ensure stability.

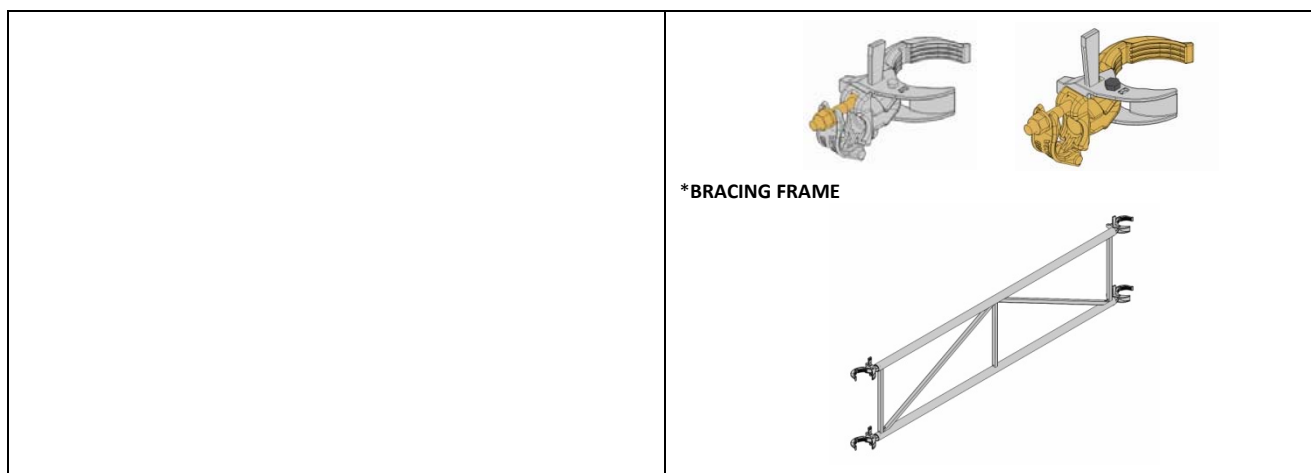

Once the boards are placed and the formwork is braced to the structure, half of the tripods may be withdrawn and placed in subsequent assemblies.

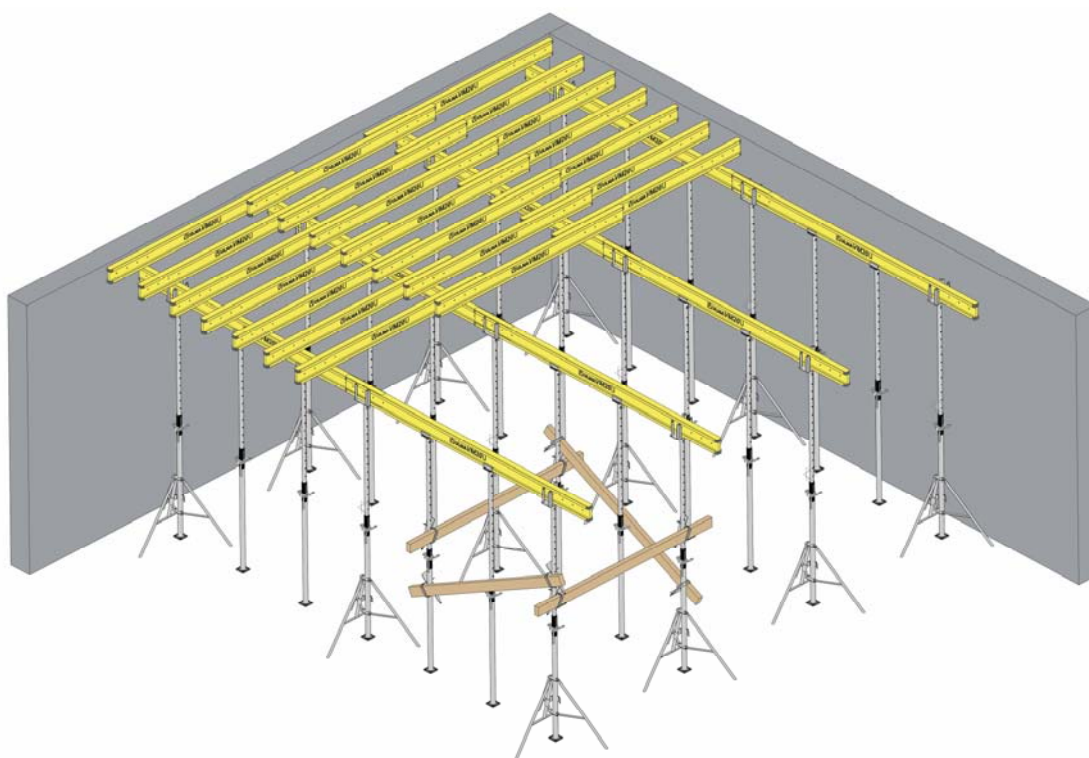

5.3.2. HEIGHT STABILITY

It is recommended to brace the props from 4 m. Normal, ECO, strong, EP and SP props with clamps and ALUPROP props with ALUPROP bracing.

TYPE OF PROP	TYPE OF BRACING
NORMAL PROP ECO PROPS STRONG PROP SP PROP EP PROP	<p>A plank is required together with the clamp to perform the bracing.</p> <p>* CLAMP SP-EP</p> 
ALUPROP PROP	<p>*SWIVEL or FIX BRACING HOOK: Tubes Ø48 are required together with the hooks to perform the bracing</p>

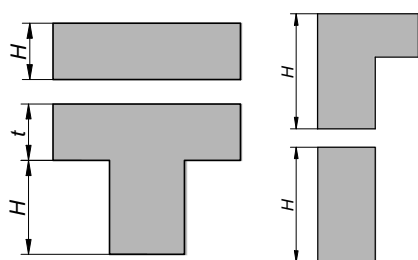

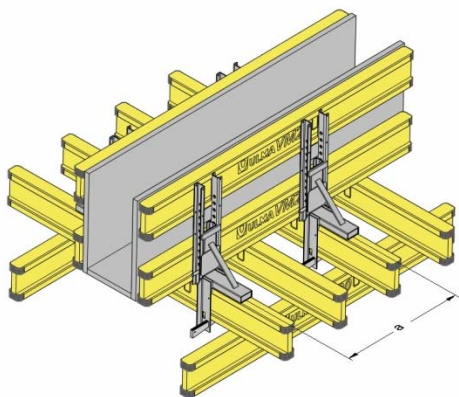

A tower must be built with the elements abovementioned (with clamps, hooks or frames depending on each case) every 50 m².

5.4. FEATURES OF THE MAIN ITEMS

5.4.1. HANGING BEAM

The maximum slab thickness that can be used with the hanging beam support is 40cm. For bigger slabs, up to 90cm, add the hanging beam supplement to the hanging beam.

PERMISSIBLE DISTANCES BETWEEN 'a' HANGING BEAMS

H (cm)	SOLID SLAB OR STRAIGHT BEAM	HANGING BEAM WITH SLAB	
	Spacing (m)	Spacing (m) with t=20cm	Spacing (m) with t=30cm
30	2.25	1.50	1.25
35	2.00	1.25	1.00
40	1.75	1.05	0.90
45	1.50	0.95	0.80
50	1.35	0.85	0.70
55	1.30	0.75	0.60
60	1.05	0.65	0.50
65	0.90	0.50	0.40
70	0.80	0.40	0.35
75	0.60	0.30	
80	0.55		
85	0.45		
90	0.35		

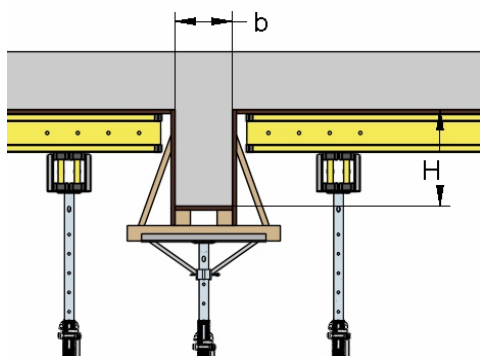

This table does not include checking the board, main beams and props, which should be checked separately.

5.4.2. CROSS PROP

Each cross prop is to use, as its name indicates, with an SP prop:

- * Cross Prop SP-30 with Prop SP-30
- * Cross Prop SP 35-40 with Prop SP-35 and Prop SP-40

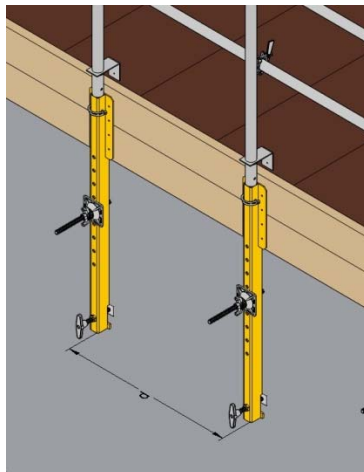

Recommended spacing distances:

- * Maximum width (b): 0.4m
- * Maximum Height (H): 0.8m
- * The cross prop halves the working load of the prop.
- * Distance between cross braces: 1.2m (check loads of beams and props).

5.4.3. WALL HANDRAIL SUPPORT

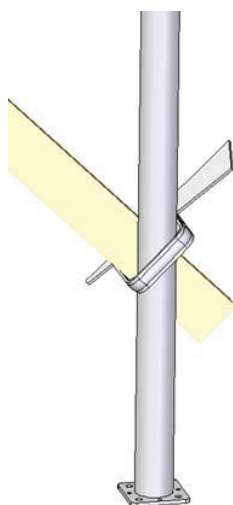

The following table defines the maximum distance (m) between the supports based on slab thickness (m) (if used as formwork stopend) and the type of handrail used.

		Maximum distance 'd' between standards (m) based on slab height (m)										
		0	0.15	0.2	0.25	0.3	0.35	0.4	0.45	0.5	0.55	0.6
2211156	HANDRAIL POST 1.5	3.30	3.30	3.30	3.30	3.30	3.20	2.80	2.40	2.00	1.70	1.50
2211185	HANDRAIL POST 1.5 WOOD	2.30	2.30	2.20	2.10	1.90	1.80	1.60	1.50	1.30	1.20	1.10
1860516	SAFETY HANDRAIL S-V	3.30	3.30	3.30	3.30	3.30	3.30	3.20	2.70	2.30	1.90	1.60
1902210	SAFETY HANDRAIL POST	2.30	2.30	2.30	2.30	2.30	2.30	2.20	1.90	1.70	1.50	1.30
	WITHOUT HANDRAIL	3.50	3.50	3.50	3.50	3.50	3.50	3.50	3.50	3.10	2.50	2.10

5.4.4. CLAMP SP-EP

The clamp SP-EP is wedged in the prop assembly plus plank. The maximum dimensions of the plank can be a width of 120mm and thickness of 60mm.

6. CONDITIONS OF USE

6.1. GENERAL SAFETY ADVICES

- It is recommended to strictly follow the instructions of the project plan.
- The general instructions of the manufacturer must be followed.
- Internal safety standards must be fulfilled.

6.1.1. Personal and collective protective equipment

- The personal protective equipments should comprise at least protective helmet, safety footwear, protective gloves and tool holder belt. Additionally, it is useful to incorporate an anti-fall harness with lifeline.
- If necessary, goggles or protective masks, hearing protection, breathing masks, reflective jackets and any other required item to fulfil the health and safety guidelines on the building site should be used.
- The safety handrail, the mobile tower, the nets under formwork and the perimeter scaffolding are means of collective protection equipment.

6.1.2. General aspects

- Openings shall be protected by covers, handrails, nets or mesh to prevent falls from different level.
- Statutory handrails are provided with the lateral formwork or perimeter scaffolding.
- Toe Boards are used with the handrails fulfilling with the laws of each country.
- Check the formwork parts and safety items. Replace them whenever necessary. Check:
 - That the parts have no dents which have diminished their section.
 - That they are not bent.
 - That their fixings are correctly working and efficient.
- For wood or plastic parts the following is to confirm:
 - That there are no dents, cracks or knot holes which might diminish their strength.
 - That they are correctly fixed to their supports.
 - Replace them whenever necessary.
- To access the formwork, statutory ladders, mobile towers or pedestrian bridges shall be used.
- Working on mobile scaffolding towers only when brakes put on. Do not move the towers while the worker is still standing on it.
- For the assembly and dismantling of the perimeter formwork, strictly obey the specific procedures.
- The working area is to be kept clean and tidy at all times. Leave the material organised and stacked. Do not leave the material untidily lying about on the formwork or on the ground.
- Do not leave any part half-assembled or half-dismantled.
- Once assembled, brace the structure correctly.
- Working with wind speeds of more than 60 km/h is strictly forbidden.
- If the building site is located nearby high voltage power lines, it is recommended to work without power supply. If this is not possible, the appropriate measures according to the respective reference standard should be taken.
- The statutory auxiliary equipment for lifting has to be appropriate to bear the loads to lift and must be checked before each use and discarded, if it is not working properly.

- Use adequate anchors for lifting as well as certified slings and lifting hooks.
- Slings attached to the material are to be fastened properly during shipment.
- No crossing below suspended loads, not even in the machinery working areas.
- Demarcate and prevent pedestrian traffic below the working areas.
- Under the circumstances that the crane operator has no visual control of the entire trajectory of the load, the crane operations are guided by a signaller who is communicating with the crane operator by means of a previously agreed sign code.
- Use of tool holder belt with pockets for small parts.
- Provide the team with mechanical means for lifting.
- Walk on marked areas only.
- Train manual handling of loads.
- Once the erection is finished, the formwork assembly shall be checked.
- The plywood surface is cleaned after each use with a cloth or a brush coated with some release agent. Wire brushes are not suitable for cleaning as they are damaging the fenolic film on the plywood.

The formwork parts should not be thrown down to the ground during their assembly, handling and dismantling in order to avoid damages.

6.1.3. Handling and maintenance conditions

- A safe erection of assembly is assured by using mobile towers, nets under formwork or lifelines.
- The Props shall be used correctly, i.e. respecting their load limits, plumbing them to the ground and with stable support.
- For the installation of the handrail, it is necessary to place the handrail support.
- In perimeter areas, the part which prevent from overturning, Chain VR, must be placed.
- To assure a proper assembly is necessary to check between uses the cleanness of plywood sides and contact areas.

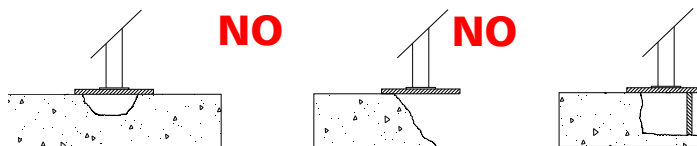

6.1.4. Concrete pouring

- Before pouring, the following must be checked:
 - The proper support of end plate of the prop on resistant and flat surfaces.
 - The correct formwork erection according to the approved layout.
 - Formwork levelling.
 - The shuttering face is impregnated with release agent.
 - Eventually, Plastic Handrail Supports are placed along the perimeter of the freshly poured slab to later place the handrail post onto the slab.
- During vibration, the vibrator must not get in contact with the formwork, otherwise the calculated loads and live loads for the slab might be exceeded.
- Avoid improper material stocks as well as accumulations and abrupt concrete pouring.
- It is recommended to pour in layers in cases in which the maximum permissible thickness for the used grid might get exceeded.
- The sudden emptying of the concreting bucket on the formwork is to be avoided. Pouring has to be done from heights which do not cause strong shaking of the formwork.
- The stripping is done when the concrete strength is sufficiently high.
- Before starting any dismantling operation, the state of the formwork has to be checked.

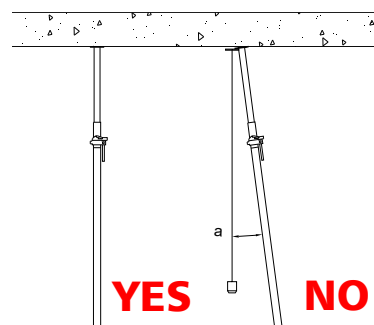

6.1.5. Safety instructions

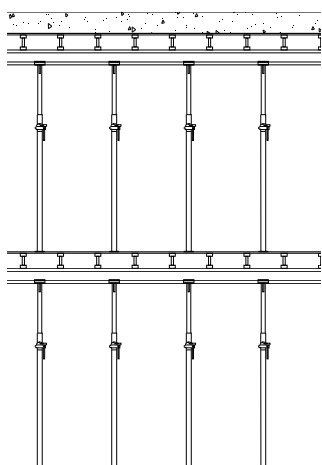

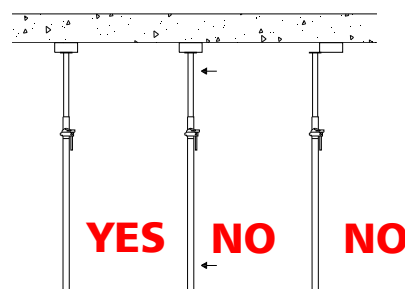

The Prop support must be horizontal, on a plane surface and with a stable base.

The Prop must be plumbed.

The load acting on the Prop is vertical and centred. No horizontal loads act on the Prop.

The Props must be used between support and load. Do not put a Prop directly on top of another, as it might cause the collapse of the structure due to effective loss of load bearing

Additional to this safety notices, it is advised to take preventive measures such as:

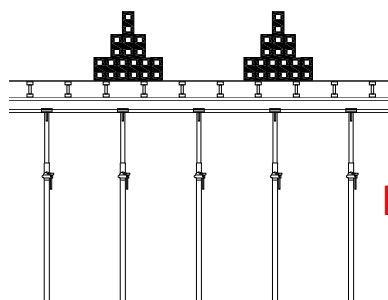

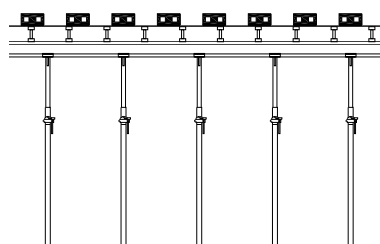

- Do not use damaged Props, with torn holes or weldings, nor with signs of deep corrosion.
- Do not overlap nor add or weld strange parts to the Prop to extend it.

Do not dismantle the Prop nor replace Prop parts by others strange to the product.

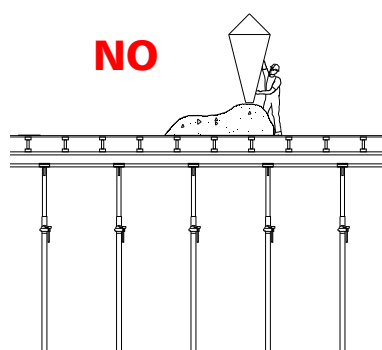

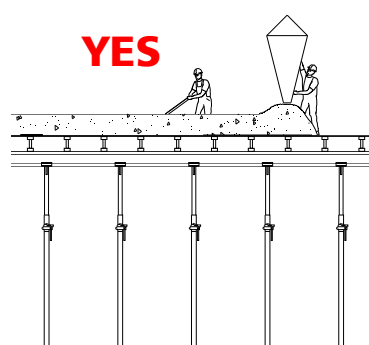

Do not hit the Prop base to strip the formwork.

**NO****YES**

Do not stock material on the formwork, not even temporarily. Always assure a uniform load distribution.

Do not leave objects fall on, nor jump on the formwork plywood.

**NO****YES**

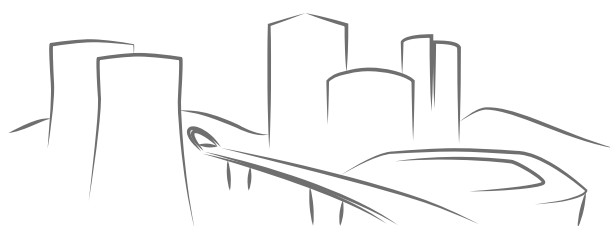

Pour the concrete in layers or steps with uniform thickness and vibrate it continuously, thus avoiding concrete accumulations.
